NCP-MCA Test Cram Pdf & NCP-MCA Valid Study Questions

The NCP-MCA practice test pdf contains the most updated and verified questions & answers, which cover all the exam topics and course outline completely. The NCP-MCA vce dumps can simulate the actual test environment, which can help you to be more familiar about the NCP-MCA Real Exam. Now, you can free download Nutanix NCP-MCA updated demo and have a try. If you have any questions about NCP-MCA pass-guaranteed dumps, contact us at any time.

Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q55-Q60):

NEW QUESTION # 55

An administrator has an existing set of VMs that were deployed before the company started using Calm. The administrator would like to now use Calm to manage those existing VMs.

What should the administrator do to manage the existing VMs?

- A. Create a Greenfield Application, select the snapshots of the VMs to manage and redeploy the VMs from the latest snapshot.
- B. Create a Brownfield Application, select the snapshots of the VMs to manage and redeploy the VMs from the latest snapshot.
- C. Create a Greenfield Application, select the VMs that are needed for each deployment from the drop down list.

- **D. Create a Brownfield Application, select the VMs that are needed for each deployment from the drop down list.**

Answer: D

Explanation:

A Brownfield Application is a type of application that allows you to import and manage existing VMs that were not deployed by Calm. You can use a Brownfield Application to perform actions such as start, stop, restart, delete, or execute scripts on the imported VMs. You can also add services, credentials, variables, and policies to the Brownfield Application blueprint. To create a Brownfield Application, you need to select a multi-VM blueprint and then choose the VMs that you want to include in the application from the drop down list. You can also filter the VMs by name, cluster, or power state.

A Greenfield Application is a type of application that allows you to deploy new VMs from scratch using Calm. You can use a Greenfield Application to provision and configure VMs on different cloud platforms, such as Nutanix AHV, VMware ESXi, AWS, Azure, or GCP. You can also add services, credentials, variables, and policies to the Greenfield Application blueprint. To create a Greenfield Application, you need to select a single-VM or a multi-VM blueprint and then specify the VM properties, such as name, image, flavor, network, storage, etc.

NEW QUESTION # 56

An administrator is setting up Self-Service to centrally manage automation across the corporate environment.

The environment leverages tunnels to communicate with the VMs within their Virtual Private Cloud (VPC) protected environments.

How should the administrator configure Self-Service to manage the VMs within a VPC?

- A. Configure the policy engine VM within the VPC to enable the tunnel VM to communicate with an external subnet that is routable to Prism Central.
- **B. Configure an external subnet to the VPC to enable the tunnel VM to reach Prism Central and establish a tunnel connection.**
- C. Configure Prism Central with an additional IP address within the VPC.
- D. Configure an external subnet to the VPC to enable the tunnel VM to reach the policy engine VM and establish a tunnel connection.

Answer: B

Explanation:

Comprehensive and Detailed Explanation

Nutanix Self-Service requires a Tunnel VM to establish communication between Prism Central and VPC- isolated workloads.

Documentation states that:

* The Tunnel VM must be able to reach Prism Central over a routable external network.

* An external subnet must exist so the Tunnel VM can initiate outbound connectivity to PC.

Thus, the correct configuration is:

Create an external subnet to allow the Tunnel VM to reach Prism Central.

Therefore, Option B is correct.

NEW QUESTION # 57

An IT Director is concerned about the available storage capacity. The Nutanix environment has 200TB of usable physical storage, but users have over-provisioned the environment in excess of 700TB. The cluster administrator has enabled compression. The IT director would like to be notified before storage capacity runs out.

What should the administrator do, to report the used capacity to the IT Director?

- A. Create a script and run every morning with a cronjob check the storage capacity send an SMS alert to the IT director.
- **B. Create a Playbook with storage capacity alert as a trigger generate a forecast report > email the IT Director as an action.**
- C. Grant the IT Director access to view the Capacity Planner within Prism Central
- D. Every morning, check the capacity used in Prism Central or prism Element.

Answer: B

Explanation:

A Playbook is a feature of Nutanix Calm that allows you to automate tasks based on certain triggers or events.

You can use a Playbook to create a workflow that monitors the storage capacity of the cluster and sends an email notification to the IT Director when the capacity reaches a certain threshold. You can also use the Playbook to generate a forecast report that shows the projected storage usage and availability based on historical data and trends.

NEW QUESTION # 58

Within a Calm blueprint, which two actions can an administrator apply to a Service under the Guest Customization section? (Choose two.)

- A. Modify the base OS image
- **B. Apply a Sysprep file**
- C. Choose UEFI or Legacy BIOS
- **D. Apply a Cloudinit Script**

Answer: B,D

Explanation:

Within a Calm blueprint, an administrator can apply two actions to a Service under the Guest Customization section: Apply a Cloudinit Script and Apply a Sysprep file. These actions allow the administrator to customize the configuration and behavior of the virtual machines that are provisioned from the blueprint. A Cloudinit Script is a set of commands or scripts that run on Linux-based virtual machines during the boot process. A Sysprep file is a configuration file that specifies the Windows settings and options for the virtual machines. These actions can be used to perform tasks such as setting the hostname, network configuration, user accounts, software installation, and more. Reference:

NEW QUESTION # 59

Prism Central reporting indicates that there are multiple memory-constrained VMs in multiple clusters. The target VMs have Memory Hot Add enabled.

Using X-Play, in what order should the Playbook actions be added to ensure the VMs are properly remediated?

- A. Power off VM, Take a VM Snapshot, VM add Memory, Resolve Alert
- B. Take a VM Snapshot, Power Off VM, VM Add Memory, Resolve Alert, Power on VM
- C. VM add Memory, Take a VM Snapshot, Resolve Alert
- **D. Take a VM Snapshot, VM add Memory, Resolve Alert**

Answer: D

Explanation:

To ensure the VMs are properly remediated, the Playbook actions should be added in the following order:

Take a VM Snapshot, VM add Memory, Resolve Alert. This is because Memory Hot Add allows the administrator to increase the memory allocation of a running VM without powering it off. Taking a VM snapshot before adding memory provides a backup point in case of any issues. Resolving the alert after adding memory clears the notification and updates the status of the VM. Powering off the VM is not necessary and may cause downtime or disruption to the applications running on the VM.
