UiPath Automation Business Analyst Associate Exam (2023.10) Sample Questions (Q79-Q84):

NEW QUESTION # 79

Which of the following describes a key feature of RPA when dealing with legacy systems?

- A. RPA requires complete system overhauls to function
- B. RPA can only operate on modern cloud-based systems
- C. RPA does not support integration with legacy systems
- **D. RPA can interact with legacy systems without the need for major changes**

Answer: D

Explanation:

A key advantage of Robotic Process Automation (RPA) is its ability to interact with legacy systems without requiring major system changes or costly infrastructure upgrades. This is especially beneficial in large enterprises where legacy systems are deeply embedded in operations and cannot be easily modified or replaced.

RPA tools like UiPath operate at the user interface level, meaning robots mimic the way humans interact with applications—clicking buttons, entering data, reading screens—regardless of whether the underlying system is modern or legacy. This makes RPA non-invasive, meaning it doesn't interfere with the backend code or require APIs or connectors to function (though it can use them when available).

This feature allows organizations to automate processes across mainframes, desktop-based applications, and other older systems where traditional integration is too complex or expensive. As a result, businesses can achieve automation and process efficiency without waiting for digital transformation or major IT investments.

In summary, RPA bridges the gap between old and new systems, allowing enterprises to innovate and optimize workflows without disrupting existing technologies.

NEW QUESTION # 80

Which of the following best describes how automation software robots operate?

- A. They physically interact with machines to perform tasks.
- B. They require constant human supervision.
- C. They write code autonomously.
- **D. They mimic human actions to interact with digital systems and applications.**

Answer: D

Explanation:

Automation software robots, particularly those built using UiPath, operate by mimicking human actions to interact with digital systems and applications. This includes actions such as clicking buttons, typing into fields, reading data from screens, extracting information from documents, navigating applications, and triggering system events. Their behavior is defined through automation workflows created by developers using tools like UiPath Studio.

These robots do not require constant supervision; unattended robots operate autonomously, while attended robots are triggered by users. They also do not interact physically with machines. Instead, they work entirely within virtual environments, desktops, and applications.

By replicating human behavior in digital workflows, robots can perform repetitive, rule-based tasks consistently, quickly, and without fatigue. This enables organizations to improve operational efficiency, reduce human error, increase accuracy, and free employees to focus on more strategic work.

Software robots do not write code on their own—developers design their workflows. However, with AI enhancements, they can assist in automation development. Still, their core functionality relies on executing predefined instructions that simulate human interaction with digital systems.

NEW QUESTION # 81

In which three stages should user availability be clearly defined and communicated?

- A. Business Case Validation, Solution Design, UAT
- B. Solution Design, Testing, Discovery
- **C. Kickoff, Process Analysis, UAT**
- D. Deployment, Hypercare, Project Closure

Answer: C

Explanation:

User availability should be clearly defined and communicated in the Kickoff, Process Analysis, and UAT stages. These stages require direct interaction with Client Team members such as process owners, subject matter experts (SMEs), and end users.

* During Kickoff, availability is discussed to plan for workshops, document reviews, and approvals.

* In Process Analysis, SMEs are needed to walk through the As-Is process for accurate documentation.

* In UAT, end users test the solution to ensure it meets business needs. Their availability is crucial for timely validation and sign-off. Clear communication of availability in these stages helps avoid scheduling conflicts, delays, and incomplete information gathering.

NEW QUESTION # 82

Which document outlines the future state of the process and modules to be developed?

- A. UAT Test Script
- B. Project Charter
- **C. Solution Design Document (SDD)**
- D. Statement of Work (SOW)

Answer: C

Explanation:

The Solution Design Document (SDD) outlines the future state (To-Be) of the business process, including the detailed technical components and modules to be developed. It is a critical output of the Solution Design stage and serves as the blueprint for the development team.

The SDD includes:

- * Automation logic and flow diagrams
- * Breakdown of reusable modules
- * Exception handling logic
- * Integration and system interaction points
- * Technical configurations and assumptions

Prepared primarily by the Solution Architect, the SDD ensures that development follows a clear and consistent direction. It helps prevent misinterpretation of business requirements and facilitates better collaboration among developers, testers, and architects.

NEW QUESTION # 83

Which UiPath platform layer includes tools such as UiPath Studio and Document Understanding?

- A. Measure
- **B. Automate**
- C. Discover
- D. Orchestrate

Answer: B

Explanation:

The Automate layer of the UiPath Business Automation Platform includes tools such as UiPath Studio, UiPath Action Center, and UiPath Document Understanding. This layer is focused on building and deploying automation workflows that execute the desired processes.

- * UiPath Studio is the development environment where automation workflows are built.
- * Document Understanding allows robots to extract, interpret, and process data from structured and unstructured documents.
- * Action Center enables human-in-the-loop automation by allowing manual intervention where needed.

The Automate layer brings the business logic to life by translating process requirements into executable robot actions. It's at the core of UiPath's capability to reduce manual effort and increase operational efficiency through software robots.
