

Valid Exam GH-500 Practice, GH-500 Exam Actual Tests

Besides this PDF format, Microsoft GH-500 practice exams in desktop and web-based versions are available to aid you in recognizing both your weaker and stronger concepts. These real Microsoft GH-500 Exam Simulator exams also points out your mistakes regarding the Microsoft GH-500 exam preparation.

Microsoft GH-500 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">• Configure and use Dependabot and Dependency Review: Focused on Software Engineers and Vulnerability Management Specialists, this section describes tools for managing vulnerabilities in dependencies. Candidates learn about the dependency graph and how it is generated, the concept and format of the Software Bill of Materials (SBOM), definitions of dependency vulnerabilities, Dependabot alerts and security updates, and Dependency Review functionality. It covers how alerts are generated based on the dependency graph and GitHub Advisory Database, differences between Dependabot and Dependency Review, enabling and configuring these tools in private repositories and organizations, default alert settings, required permissions, creating Dependabot configuration files and rules to auto-dismiss alerts, setting up Dependency Review workflows including license checks and severity thresholds, configuring notifications, identifying vulnerabilities from alerts and pull requests, enabling security updates, and taking remediation actions including testing and merging pull requests.
Topic 2	<ul style="list-style-type: none">• Describe GitHub Advanced Security best practices, results, and how to take corrective measures: This section evaluates skills of Security Managers and Development Team Leads in effectively handling GHAS results and applying best practices. It includes using Common Vulnerabilities and Exposures (CVE) and Common Weakness Enumeration (CWE) identifiers to describe alerts and suggest remediation, decision-making processes for closing or dismissing alerts including documentation and data-based decisions, understanding default CodeQL query suites, how CodeQL analyzes compiled versus interpreted languages, the roles and responsibilities of development and security teams in workflows, adjusting severity thresholds for code scanning pull request status checks, prioritizing secret scanning remediation with filters, enforcing CodeQL and Dependency Review workflows via repository rulesets, and configuring code scanning, secret scanning, and dependency analysis to detect and remediate vulnerabilities earlier in the development lifecycle, such as during pull requests or by enabling push protection.
Topic 3	<ul style="list-style-type: none">• Configure and use secret scanning: This domain targets DevOps Engineers and Security Analysts with the skills to configure and manage secret scanning. It includes understanding what secret scanning is and its push protection capability to prevent secret leaks. Candidates differentiate secret scanning availability in public versus private repositories, enable scanning in private repos, and learn how to respond appropriately to alerts. The domain covers alert generation criteria for secrets, user role-based alert visibility and notification, customizing default scanning behavior, assigning alert recipients beyond admins, excluding files from scans, and enabling custom secret scanning within repositories.

Topic 4	<ul style="list-style-type: none"> • Configure and use Code Scanning with CodeQL: This domain measures skills of Application Security Analysts and DevSecOps Engineers in code scanning using both CodeQL and third-party tools. It covers enabling code scanning, the role of code scanning in the development lifecycle, differences between enabling CodeQL versus third-party analysis, implementing CodeQL in GitHub Actions workflows versus other CI tools, uploading SARIF results, configuring workflow frequency and triggering events, editing workflow templates for active repositories, viewing CodeQL scan results, troubleshooting workflow failures and customizing configurations, analyzing data flows through code, interpreting code scanning alerts with linked documentation, deciding when to dismiss alerts, understanding CodeQL limitations related to compilation and language support, and defining SARIF categories.
Topic 5	<ul style="list-style-type: none"> • Describe the GHAS security features and functionality: This section of the exam measures skills of Security Engineers and Software Developers and covers understanding the role of GitHub Advanced Security (GHAS) features within the overall security ecosystem. Candidates learn to differentiate security features available automatically for open source projects versus those unlocked when GHAS is paired with GitHub Enterprise Cloud (GHEC) or GitHub Enterprise Server (GHES). The domain includes knowledge of Security Overview dashboards, the distinctions between secret scanning and code scanning, and how secret scanning, code scanning, and Dependabot work together to secure the software development lifecycle. It also covers scenarios contrasting isolated security reviews with integrated security throughout the development lifecycle, how vulnerable dependencies are detected using manifests and vulnerability databases, appropriate responses to alerts, the risks of ignoring alerts, developer responsibilities for alerts, access management for viewing alerts, and the placement of Dependabot alerts in the development process.

GH-500 Exam Actual Tests, GH-500 Training Solutions

Our GitHub Advanced Security test torrent was designed by a lot of experts in different area. You will never worry about the quality and pass rate of our study materials, it has been helped thousands of candidates pass their exam successful and helped them find a good job. If you choose our GH-500 study torrent, we can promise that you will not miss any focus about your exam. There are three different versions to meet customers' needs you can choose the version that is suitable for you to study. If you buy our GitHub Advanced Security test torrent, you will have the opportunity to make good use of your scattered time to learn whether you are at home, in the company, at school, or at a metro station.

Microsoft GitHub Advanced Security Sample Questions (Q50-Q55):

NEW QUESTION # 50

In the pull request, how can developers avoid adding new dependencies with known vulnerabilities?

- A. Enable Dependabot alerts.
- B. Enable Dependabot security updates.
- C. Add Dependabot rules.
- D. Add a workflow with the dependency review action.

Answer: D

Explanation:

To detect and block vulnerable dependencies before merge, developers should use the Dependency Review GitHub Action in their pull request workflows. It scans all proposed dependency changes and flags any packages with known vulnerabilities. This is a preventative measure during development, unlike Dependabot, which reacts after the fact.

NEW QUESTION # 51

What does code scanning do?

- A. It scans your entire Git history on branches present in your GitHub repository for any secrets
- B. It contacts maintainers to ask them to create security advisories if a vulnerability is found

- C. It prevents code pushes with vulnerabilities as a pre-receive hook
- **D. It analyzes a GitHub repository to find security vulnerabilities**

Answer: D

Explanation:

Code scanning is a static analysis feature that examines your source code to identify security vulnerabilities and coding errors. It runs either on every push, pull request, or a scheduled time depending on the workflow configuration.

It does not automatically contact maintainers, scan full Git history, or block pushes unless explicitly configured to do so.

NEW QUESTION # 52

What happens when you enable secret scanning on a private repository?

- **A. GitHub performs a read-only analysis on the repository.**
- B. Your team is subscribed to security alerts.
- C. Dependency review, secret scanning, and code scanning are enabled.
- D. Repository administrators can view Dependabot alerts.

Answer: A

Explanation:

When secret scanning is enabled on a private repository, GitHub performs a read-only analysis of the repository's contents. This includes the entire Git history and files to identify strings that match known secret patterns or custom-defined patterns.

GitHub does not alter the repository, and enabling secret scanning does not automatically enable code scanning or dependency review - each must be configured separately.

NEW QUESTION # 53

As a developer, you need to configure a code scanning workflow for a repository where GitHub Advanced Security is enabled. What minimum repository permission do you need?

- A. Read
- B. Admin
- C. None
- **D. Write**

Answer: D

Explanation:

To create or modify a code scanning workflow file (typically under `.github/workflows/codeql-analysis.yml`), you must have Write access to the repository.

Write permission allows you to commit the workflow file, which is required to run or configure code scanning using GitHub Actions.

NEW QUESTION # 54

Which of the following statements most accurately describes push protection for secret scanning custom patterns?

- A. Push protection must be enabled for all, or none, of a repository's custom patterns.
- B. Push protection is not available for custom patterns.
- C. Push protection is enabled by default for new custom patterns.
- **D. Push protection is an opt-in experience for each custom pattern.**

Answer: D

Explanation:

Comprehensive and Detailed Explanation:

Push protection for secret scanning custom patterns is an opt-in feature. This means that for each custom pattern defined in a repository, maintainers can choose to enable or disable push protection individually. This provides flexibility, allowing teams to enforce push protection on sensitive patterns while leaving it disabled for others.
