## Cloud Security Alliance Certificate of Cloud Security Knowledge v5 (CCSKv5.0) Sample Questions (Q137-Q142):

### NEW QUESTION # 137

In a cloud context, what does entitlement refer to in relation to a user's permissions?

- A. The authentication methods a user is required to use when accessing the cloud environment.
- B. The level of technical support a user is entitled to from the cloud service provider.
- C. The ability for a user to grant access permissions to other users in the cloud environment.
- **D. The resources or services a user is granted permission to access in the cloud environment.**

**Answer: D**

Explanation:

In a cloud context, entitlement refers to the specific resources or services a user is granted permission to access based on their roles or permissions. This includes access to applications, data, or cloud services, and is typically managed through Identity and Access Management (IAM) systems, which define what users can do and what they can access within the cloud environment.

### NEW QUESTION # 138

Which of the following are two most effective ways of protection against data breaches in the cloud environment?

- **A. Multifactor Authentication and Encryption**
- B. Contracts and SLAs
- C. Encryption and Honeypot
- D. Data Loss Prevention techniques and Web Application Firewall

**Answer: A**

Explanation:

Multifactor Authentication and Encryption are most effective protect mechanisms against data breaches in cloud environment. Other options do form part of overall security strategy in cloud but Option D is the strongest contender for the answer.

### NEW QUESTION # 139

When establishing a cloud incident response program, what access do responders need to effectively analyze incidents?

- A. Access limited to log events for incident analysis
- **B. Persistent read access and controlled write access for critical situations**
- C. Full-read access without any approval process
- D. Unlimited write access for all responders at all times

**Answer: B**

Explanation:

When establishing a cloud incident response program, responders need persistent read access to resources, such as logs, configurations, and system data, in order to analyze and investigate incidents effectively. This access allows them to view and understand the nature of the incident, the affected systems, and any potential risks. In critical situations, controlled write access is necessary to take remedial actions, such as stopping malicious processes, patching vulnerabilities, or implementing other immediate security measures, but write access should be restricted and carefully managed to prevent misuse or errors.

Access limited to log events is too restrictive, as responders need more than just log events to fully analyze incidents. Unlimited write access for all responders is too broad and dangerous; unrestricted write access could lead to accidental or malicious changes to critical systems. Full-read access without any approval process could be dangerous if it allows responders too much access without appropriate oversight, potentially violating privacy or security policies.

### NEW QUESTION # 140

In which service model, cloud consumer is responsible to manage authorizations and entitlements only?

- A. Infrastructure as a Service (IaaS)
- B. All of them
- **C. Software as a Service (SaaS)**
- D. Platform as a Service (PaaS)

**Answer: C**

Explanation:

It is important to read the question carefully and then choose the best answer. Although cloud consumer is responsible for authorizations and entitlements across all service models but questions uses "only". Therefore, answer is Software as a Service (SaaS) and a SaaS provider is responsible for perimeter security, logging/monitoring/auditing, and application security.

### NEW QUESTION # 141

According to Cloud Security Alliance logical model of cloud computing, which of the following defines the protocols and mechanisms that provide the interface between the infrastructure layer and the other layers.

- A. Infostructure
- B. Infrastructure
- C. Metastructure
- D. Applistructure

**Answer: C**

Explanation:

According to CSA Securityguidelines4.0. Metastucture is defined as the protocols and mechanisms that provide the interface between the infrastructure layer and the other layers. The glue that ties the technologies and enables management and configuration.
