What's more, part of that SureTorrent HPE7-A01 dumps now are free: <https://drive.google.com/open?id=1Tniu5TxJoTk2TDrZDzgdTfUGeLnA2zUw>

In order to meet different needs of every customer, we will provide three different versions of HPE7-A01 exam questions including PC version, App version and PDF version for each customer to choose from. Most importantly, the passing rate of our HPE7-A01 Study Materials is as high as 98 % - 99 %. It can almost be said that you can pass the exam only if you choose our HPE7-A01 learning guide. And our HPE7-A01 practice engine won't let you down.

HP HPE7-A01 exam is a highly respected certification that tests the knowledge and skills of networking professionals in the Aruba Campus Switching solutions. Passing HPE7-A01 exam not only demonstrates the candidate's expertise in networking but also opens up a world of career opportunities.

With the increasing demand for wireless networking solutions in today's businesses, the HPE7-A01 certification has become essential for IT professionals who want to advance their careers or demonstrate their expertise in the field. Aruba Certified Campus Access Professional Exam certification attests to a professional's ability to configure and optimize wireless networks, implement security policies and protocols, and resolve technical issues related to wireless networking.

Becoming an Aruba Certified Campus Access Professional through the HPE7-A01 Exam provides a range of benefits to IT professionals. First, it validates their expertise in Aruba wireless technologies, which is highly sought after by organizations looking to deploy or enhance their wireless networks. Additionally, certified professionals can expect to earn higher salaries and receive more job opportunities than their non-certified counterparts. Finally, obtaining the HPE7-A01 certification demonstrates a commitment to ongoing learning and professional development in the field of wireless networking.

Valid HP HPE7-A01 Test Syllabus - HPE7-A01 Actual Dumps

Without doubt, our HPE7-A01 practice dumps keep up with the latest information and contain the most valued key points that will show up in the real HPE7-A01 exam. Meanwhile, we can give you accurate and instant suggestion for our customer services know every detail of our HPE7-A01 Exam Questions. And they are pleased to give guide for 24 hours online. You can get assistant by them as long as you made your inquire.

HP Aruba Certified Campus Access Professional Exam Sample Questions (Q139-Q144):

NEW QUESTION # 139

How is Dynamic Multicast Optimization (DMO) implemented in an HPE Aruba wireless network?

DMO is configured individually for each SSID in use in the network.

The AP uses OOS to provide equal air time for multicast traffic,

DMO is configured globally for each SSID in use in the network.

The controller converts multicast streams into unicast streams.

- A. DMO is not configured globally for each SSID in use in the network. DMO is configured individually for each SSID, as different SSIDs may have different multicast requirements.
- B. DMO is configured individually for each SSID in use in the network.
DMO is a feature that allows the AP to convert multicast streams into unicast streams over the wireless link. This enhances the quality and reliability of streaming video, while preserving the bandwidth available to the non-video clients. DMO is configured individually for each SSID in use in the network, as different SSIDs may have different multicast requirements. According to the Aruba document *Configuring WLAN Settings for an SSID Profile*, one of the steps to configure DMO is: *Dynamic multicast optimization: Select Enabled to allow IAP to convert multicast streams into unicast streams over the wireless link. Enabling Dynamic Multicast Optimization (DMO) enhances the quality and reliability of streaming video, while preserving the bandwidth available to the non-video clients.*
The other options are incorrect because:
- C. The controller does not convert multicast streams into unicast streams. The AP does the conversion, as it is closer to the wireless clients and can optimize the transmission based on the client capabilities and channel conditions.
- D. The AP does not use QoS to provide equal air time for multicast traffic. QoS is a feature that prioritizes different types of traffic based on their importance and latency sensitivity. QoS does not affect how multicast streams are transmitted over the wireless link.

Answer: B

Explanation:

The correct answer is

NEW QUESTION # 140

A customer is using Aruba Cloud Guest, but visitors keep complaining that the captive portal page keeps coming up after devices go to sleep Which solution should be enabled to deal with this issue?

- A. MAC Caching under the splash page
- B. Wireless Caching under the splash page
- C. MAC Caching under the user-role
- D. MAC Caching under the WLAN

Answer: D

NEW QUESTION # 141

With the Aruba CX switch configuration, what is the first-hop protocol feature that is used for VSX L3 gateway as per Aruba recommendation?

- A. Active-Active VRRP

- B. Active Gateway
- C. SVI with vsx-sync
- D. VRRP

Answer: B

Explanation:

Explanation

Active Gateway is the first-hop protocol feature that is used for VSX L3 gateway as per Aruba recommendation. Active Gateway is a feature that allows both VSX peers to act as active gateways for different subnets, eliminating the need for VRRP or other first-hop redundancy protocols. Active Gateway also provides fast failover and load balancing for L3 traffic across the VSX peers. The other options are incorrect because they are either not recommended or not supported by Aruba CX VSX. References:

NEW QUESTION # 142

Using Aruba best practices what should be enabled for visitor networks where encryption is needed but authentication is not required?

- A. Wi-Fi Protected Access 3 Enterprise
- B. Wired Equivalent Privacy
- C. Open Network Access
- D. Opportunistic Wireless Encryption

Answer: D

Explanation:

Opportunistic Wireless Encryption (OWE) is a feature that provides encryption for open wireless networks without requiring authentication. OWE uses an enhanced version of the 4-way handshake to establish a pairwise key between the client and the AP, which is then used to encrypt the wireless traffic using WPA2 or WPA3 protocols. OWE can be used for visitor networks where encryption is needed but authentication is not required. Reference: https://www.arubanetworks.com/assets/tg/TG_OWE.pdf

NEW QUESTION # 143

Your customer is having connectivity issues with a newly-deployed Microbranch group. The access points in this group are online in Aruba Central, but no VPN tunnels are forming.

What is the most likely cause of this issue?

- A. There is a time difference between the AP and the gateways. The gateways should have NTP added.
- B. The SSL certificate on the gateway used to encrypt the connection has not been added to the APs trust list.
- C. The gateway group is running in automatic cluster mode and should be in manual cluster mode.
- D. There may be a firewall blocking GRE tunneling between the AP and the gateway.

Answer: D

Explanation:

This is the most likely cause of the issue where the access points in a Microbranch group are online in Aruba Central, but no VPN tunnels are forming. A Microbranch group is a group that contains both APs and Gateways and allows them to form VPN tunnels for secure communication. The VPN tunnels use GRE (Generic Routing Encapsulation) as the encapsulation protocol and IPsec as the encryption protocol. If there is a firewall blocking GRE traffic between the AP and the gateway, the VPN tunnels cannot be established.

The other options are incorrect because they either do not affect the VPN tunnel formation or do not apply to a Microbranch group.
