As a main supplier for Plat-Dev-301 Certification Exam training, ValidVCE's Plat-Dev-301 experts continually provide you the high quality product and a free online customer service, but also update the exam outline with the fastest speed.

Salesforce Certified Platform Developer II - Multiple Choice Sample Questions (Q142-Q147):

NEW QUESTION # 142

A developer is asked to build a solution that will automatically send an email to the customer when an Opportunity stage changes. The solution must scale to allow for 10,000 emails per day. The criteria to send the email should be evaluated after certain conditions are met.

What is the optimal way to accomplish this?

- A. Use SingleEmailMessage() with an Apex trigger.
- B. Use MassEmailMessage () With an Apex trigger.
- C. Use a Workflow Email Alert.
- **D. Use an Email Alert with Flow Builder.**

Answer: D

Explanation:

Using an Email Alert with Flow Builder allows for scalable solutions that can handle large volumes of emails, and it offloads the processing from Apex to Salesforce's declarative automation tools. This approach is also bulk-safe, as it does not rely on Apex code that could hit governor limits.

NEW QUESTION # 143

Refer to the markup below:

```
<template>
  <!-- ... other code ... -->
  <lightning-record-form
    record-id={recordId}
    object-api-name="Account"
    layout-type="Full">
  </lightning-record-form>
</template>
```

A Lightning web component displays the Account name and two custom fields out of 275 that exist on the object. The custom fields are correctly declared and populated. However, the developer receives complaints that the component performs slowly. What can the developer do to improve the performance?

- A. Add `density="compact"` to the component.
- B. Replace `Layout-type="Full"` with `Layout-type="Partial"`.
- C. Add `cache="true"` to the component.
- D. Replace `layout-type="Full"` with `fields={fields}`.

Answer: D

Explanation:

To improve performance, the developer should specify only the fields needed by using the `fields` attribute in the `lightning-record-form` instead of loading all fields with `layout-type="Full"`. This reduces the amount of data being retrieved and processed, thus improving the component's performance.

NEW QUESTION # 144

Universal Containers (UC) has an ERP system that stores customer information. When an Account is created in Salesforce, the ERP system's REST endpoint for creating new customers must automatically be called with the Account information. If the call to the ERP system fails, the Account should still be created. Accounts in the UC org are only created, one at a time, by users in the UC customer on-boarding department.

What should a developer implement to make the call to the ERP system's REST endpoint?

- A. REST call from JavaScript
- B. Headless Quick Action
- C. Call a Queueable from a Trigger
- D. Apex Continuation

Answer: C

Explanation:

Since the requirement is to make a callout to an external ERP system when an Account is created and still allow for the Account creation even if the call fails, a Queueable class called from a trigger is the best solution. Queueable Apex allows you to submit jobs for asynchronous processing similar to future methods but with additional benefits such as chaining jobs and monitoring the job status.

By using a Queueable, the callout can be made after the Account is created, which respects the Salesforce order of execution and

avoids the limitation of callouts not being allowed after DML operations in the same transaction. This approach also does not block the user interface or the creation of the Account record if the callout to the ERP system takes a long time or fails.
Salesforce Documentation on Queueable Apex: Using Queueable Apex to Perform Jobs Salesforce Developer Guide on Asynchronous Apex: Queueable Apex

NEW QUESTION # 145

A developer wrote a test class that successfully asserts a trigger on Account. It fires and updates data correctly in a sandbox environment.

A Salesforce admin with a custom profile attempts to deploy this trigger via a change set into the production environment, but the test class fails with an Insufficient privileges error.

What should a developer do to fix the problem?

- A. Add `System.runAs()` to the test class to execute the trigger as a user with the correct object permissions.
- B. Add `seeAllData=true` to the test class to work within the sharing model for the production environment.
- C. Configure the production environment to enable "Run All Tests as Admin User."
- D. Verify that `Test.startTest()` is not inside a For loop in the test class.

Answer: A

Explanation:

When a test class fails with an "Insufficient privileges" error during deployment, it indicates that the user profile under which the tests are being executed doesn't have the necessary permissions to perform the actions required by the test. In a sandbox, the test might have been running with a different set of permissions compared to the production environment.

By using `System.runAs()`, you can specify a user context in which the test should run, which allows you to simulate the appropriate permissions. For this to work, you need to create a `User` instance in your test class with the profile that has the necessary permissions and then enclose the logic of your test within a `System.runAs()` block with this user.

This is a preferred solution over `seeAllData=true`, which would give the test access to all data in the production environment, potentially leading to tests that are not isolated and thus less reliable. It's also preferred over changing organization-wide settings or relying on specific setup in test classes, such as making sure `Test.startTest()` is not inside a loop.

Salesforce Documentation on Using the `runAs` Method: Testing with the `runAs` Method Salesforce Help Article on System Permissions: Profiles and Permissions

NEW QUESTION # 146

A developer has a Visualforce page that automatically assigns ownership of an Account to a queue upon save. The page appears to correctly assign ownership, but an assertion validating the correct ownership fails.

What can cause this problem?

- A. The test class does not implement the Queueable interface.
- B. The test class does not use the `seeAllData=true` annotation.
- C. The test class does not retrieve the updated value from the database.
- D. The test class does not use the Bulk API for loading test data.

Answer: C

Explanation:

If the test class does not retrieve the updated value from the database, it will not see any changes made by the page logic. This can cause assertions that check for those changes to fail. The test should query for the most recent value from the database after the operation that is supposed to update the value.

NEW QUESTION # 147

.....

For added reassurance, we also provide you with up to 1 year of free Salesforce Dumps updates and a free demo version of the actual product so that you can verify its validity before purchasing. The key to passing the Salesforce Plat-Dev-301 exam on the first try is vigorous Salesforce Certified Platform Developer II - Multiple Choice (Plat-Dev-301) practice. And that's exactly what you'll get when you prepare from our Salesforce Certified Platform Developer II - Multiple Choice (Plat-Dev-301) practice material. Each format of our Plat-Dev-301 study material excels in its own way and serves to improve your skills and gives you an inside-out

understanding of each exam topic.
