New 156-836 Reliable Exam Braindumps | Efficient Actual 156-836 Test Answers: Check Point Certified Maestro Expert - R81 (CCME)

We can promise that you would like to welcome this opportunity to kill two birds with one stone. If you choose our 156-836 Test Questions as your study tool, you will be glad to study for your exam and develop self-discipline, our 156-836 latest question adopt diversified teaching methods, and we can sure that you will have passion to learn by our products. We believe that our products will help you successfully pass your exam and hope you will like our product.

CheckPoint Check Point Certified Maestro Expert - R81 (CCME) Sample Questions (Q63-Q68):

NEW QUESTION # 63
The core four manual diagnostic tools include:
asg diag verify, asg perf -v, orch_stat -all, and

- A. asg diag verify
- B. hcp -r all
- C. asg stat -v
- D. cpinfo

Answer: C

Explanation:
Explanation
"Asg stat -v" could be a part of the core diagnostic tools, providing valuable statistics and information for manual diagnostics.

NEW QUESTION # 64
Where should sx_api_ports_dump.py command be ran?

- A. Orchestrator
- B. Management server
- C. SMO Appliance
- D. Security Group

Answer: A

Explanation:
The sx_api_ports_dump.py command should be run on the Orchestrator, which is the device that manages the communication and the configuration of the Security Groups and the SGMs. The command shows the port mapping and the traffic distribution for each Security Group, as well as the backplane bonds and the Orchestrator ports. The command does not work on the Management server, the Security Group, or the SMO Appliance, as they do not have the same role and functionality as the Orchestrator.

NEW QUESTION # 65
Which command is used to set the number of sites in a Maestro environment?

- A. set maestro configuration orchestrator-site-id
- B. set maestro orchestrator-site-amount
- C. set maestro configuration orchestrator-site-amount
- D. set maestro configuration orchestrator-site-number

Answer: C

Explanation:
Explanation
This command is used to set the number of sites in a Maestro environment, which can be either one or two.
The number of sites determines the site-sync configuration and the failover policies for the Security Groups and the Security Group Members. The default value is one, and it can be changed only before the first Security Group is created.

NEW QUESTION # 66
In case of Correction, where is information about Owner stored?

- A. In Connection table of Target Appliances
- B. In Correction tables of all Appliances participating in Correction Layer flow

- C. In Correction table of Target Appliance
- D. In Connection tables of all Appliances participating in Correction Layer flow

Answer: B

Explanation:
Explanation
The Correction Layer is a mechanism that handles asymmetric connections in systems with several cluster members. It allows traffic flow to be handled by a single cluster member, even if the flow is asymmetric1 The Correction Layer works as follows:
*When a packet arrives at a cluster member, it checks if it is the owner of the connection. If yes, it processes the packet normally. If not, it checks the Correction table to find the owner of the connection.
*If the owner is found in the Correction table, the packet is forwarded to the owner with a Correction Layer header. The owner then processes the packet and removes the Correction Layer header before sending it to the destination.
*If the owner is not found in the Correction table, the packet is forwarded to the Maestro Orchestrator (MHO) with a Correction Layer header. The MHO then checks its own Correction table to find the owner of the connection. If the owner is found, the MHO forwards the packet to the owner with a Correction Layer header.
If the owner is not found, the MHO drops the packet and sends an ICMP error message to the source.
*The Correction tables are updated by the MHO whenever a new connection is established or an existing connection is terminated. The MHO sends Correction Layer messages to all cluster members to inform them about the owner of each connection2

NEW QUESTION # 67
What is the difference between Dual-Site and Dual-Room?

- A. Dual-Room is Active / Standby and Dual-Site is Active / Active
- B. Dual-Room is a kind of Dual-Site deployment within the same building
- C. Dual-Room is a Single-Site deployment where all Appliances are connected to both orchestrators
- D. They are the same

Answer: B
