EC-COUNCIL Computer Hacking Forensic Investigator (CHFI-v11) Sample Questions (Q209-Q214):

NEW QUESTION # 209

During an incident-response project at a biotech company in San Diego, California, the team must move 600 TB of research datasets from an isolated lab network to Google Cloud, but the site has limited bandwidth and no direct peering. They need a secure, offline method to ship the data to Google for upload into Cloud Storage. Which Google Cloud service fits this requirement?

- A. Data Transfer Services
- B. Cloud Storage for Firebase
- C. Google Cloud Backup and DR
- **D. Transfer Appliance**

Answer: D

Explanation:

The correct answer is B because Google Transfer Appliance is specifically designed for large-scale offline data movement into Google Cloud when network bandwidth is limited or impractical. Google documents it as a high-capacity storage appliance that customers load on-premises and then securely ship to a Google upload facility, where the data is transferred into Cloud Storage. That matches the scenario exactly: the site is isolated, the bandwidth is constrained, and the volume is extremely large at 600 TB. In CHFI v11, cloud forensics includes understanding cloud platforms and evidence acquisition approaches, so recognizing the difference between online transfer services and offline shipping methods is important. Data Transfer Services generally rely on network-based transfers and are not the best choice when direct connectivity is a bottleneck.

Cloud Storage for Firebase is unrelated to bulk evidence migration, and Backup and DR is intended for protection and recovery workflows rather than secure offline ingestion. When the exam scenario stresses secure shipment of very large datasets into Google Cloud without relying on available bandwidth, Transfer Appliance is the only option that cleanly fits the operational requirement.

NEW QUESTION # 210

Forensic Investigator Patel is analyzing network traffic related to a cyber-attack. The traffic was routed through the Tor network, making it challenging to trace the origin of malicious activities. During the investigation, Patel identifies suspicious traffic leaving the Tor network through a specific relay. In the investigation, which type of Tor relay is most likely to face legal scrutiny and complaints due to its visibility to destination servers, even if it is not the origin of malicious traffic?

- A. Transfer Relay
- B. Entry Relay
- C. Middle Relay
- **D. Exit Relay**

Answer: D

Explanation:

According to the CHFI v11 Dark Web and Tor Browser Forensics objectives, the Tor network anonymizes user traffic by routing it through a series of relays: Entry (Guard) Relay # Middle Relay # Exit Relay. Each relay plays a distinct role in preserving anonymity, but only one relay is directly visible to the destination server.

The Exit Relay is the final node in the Tor circuit and is responsible for forwarding decrypted traffic from the Tor network to the target destination on the regular internet. As a result, destination servers see the IP address of the exit relay, not the original attacker. This makes exit relays highly visible and frequently misattributed as the source of malicious activity such as hacking attempts, scanning, spam, or data exfiltration.

CHFI v11 explicitly notes that exit relays commonly face legal complaints, abuse reports, and law enforcement scrutiny, even though they do not originate the traffic. Investigators must understand this distinction to avoid false attribution during dark web investigations. Entry relays only see the client IP but not the destination, and middle relays see neither source nor destination. "Transfer relay" is not a valid Tor relay type.

From a forensic and legal perspective, recognizing the role of exit relays is critical when analyzing Tor-related incidents, as they represent the point of exposure to external networks.

Therefore, the Tor relay most likely to face legal scrutiny due to its visibility to destination servers-fully aligned with CHFI v11-is theExit Relay, makingOption Athe correct answer.

NEW QUESTION # 211

_____ allows a forensic investigator to identify the missing links during investigation.

- A. Chain of custody
- B. Evidence preservation
- C. Exhibit numbering
- D. Evidence reconstruction

Answer: D

NEW QUESTION # 212

Emily, a cyber forensic investigator, has been called upon to investigate a case involving smartphone evidence. The primary devices are an Android and an iOS phone. Emily decides to perform a logical acquisition on both devices to gather evidence. From the given choices, which tool should she use that can provide a thorough logical acquisition of both Android and iOS devices?

- A. UFED Cellebrite
- B. FTK Imager
- C. ADB (Android Debug Bridge)
- D. iPhone Backup Extractor

Answer: A

Explanation:

Option B. UFED Cellebrite is the strongest answer because CHFI v11 explicitly includes Logical Acquisition of Android and iOS Devices , Physical Acquisition of Android and iOS Devices , and Android and iOS Forensic Analysis under mobile forensics. The question asks for a tool that can perform a thorough logical acquisition of both Android and iOS , and among the listed options, UFED Cellebrite is the one most clearly suited to cross-platform mobile forensic collection.

ADB is Android-specific and does not address iOS acquisition. FTK Imager is primarily used for disk imaging and evidence preview rather than full mobile logical acquisition across both ecosystems. iPhone Backup Extractor focuses on iPhone backup data and does not cover Android in the same way.

Because the scenario requires a single solution that supports both major mobile platforms, the most appropriate CHFI-aligned answer is UFED Cellebrite . It matches the blueprint's mobile acquisition objectives and the practical need for a forensic tool capable of structured logical collection from both Android and iOS devices.

NEW QUESTION # 213

Which Event Correlation approach assumes and predicts what an attacker can do next after the attack by studying statistics and probability?

- A. Profile/Fingerprint-Based Approach
- B. Bayesian Correlation
- C. Time (Clock Time) or Role-Based Approach
- D. Automated Field Correlation

Answer: B
