

# Free PDF 2026 Nutanix Accurate NCP-MCA: New Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Test Vce

BONUS!!! Download part of Exam-Killer NCP-MCA dumps for free: [https://drive.google.com/open?id=1L1u6ErzIVNwqe8DoLi4wR-L\\_fOI7LAeO](https://drive.google.com/open?id=1L1u6ErzIVNwqe8DoLi4wR-L_fOI7LAeO)

If you are curious or doubtful about the proficiency of our NCP-MCA practice materials, we can explain the painstakingly word we did behind the light. By abstracting most useful content into the NCP-MCA practice materials, they have help former customers gain success easily and smoothly. The most important part is that all contents were being sifted with diligent attention. No errors or mistakes will be found within our NCP-MCA practice materials. We stress the primacy of customers' interests, and make all the preoccupation based on your needs.

We boost the professional and dedicated online customer service team. They are working for the whole day, weak and year to reply the clients' question about our NCP-MCA study question and solve the clients' problem as quickly as possible. If the clients have any problem about the use of our NCP-MCA Exam Practice materials and the refund issue they can contact our online customer service at any time, our online customer service personnel will reply them quickly. So you needn't worry about you will encounter the great difficulties when you use our NCP-MCA test pdf.

## New Nutanix NCP-MCA Dumps Get Ready With NCP-MCA Exam Questions

Our NCP-MCA study materials are compiled specially for time-sensitive exam candidates if you are wondering. Eliminating all invaluable questions, we offer NCP-MCA practice guide with real-environment questions and detailed questions with unreliable prices upon them and guarantee you can master them effectively. As you see on our website, our price of the NCP-MCA Exam Question is really reasonable and favourable.

## Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q66-Q71):

### NEW QUESTION # 66

An application developer has been given operator permissions within a Project. The developer has been tasked with creating a blueprint that will create a Linux VM with the application NGINX installed and configured. What is required to complete this task?

- A. The developer will create a single-VM blueprint. Select Linux as the operating system. Then create a shell task to install NGINX.
- B. The developer must request additional permissions before taking the steps to create the Linux blueprint and task sequence.
- C. The developer will import a Linux blueprint into the project with the required task sequence pre-created and select the image.
- D. The developer will create a multi-VM blueprint within the specified project.

**Answer: A**

Explanation:

In Self-Service, an Operator role can:

- \* Create blueprints
- \* Modify blueprints
- \* Add tasks (shell, PowerShell, script, package installs, etc.)
- \* Use project-provided resources (images, networks, credentials)

To deploy a Linux VM with NGINX:

- \* A single-VM blueprint is sufficient.
- \* Developer must select Linux substrate.
- \* Installation of NGINX occurs through a shell task in the blueprint's package or service.

No additional permissions are required for an Operator to perform these actions.

Therefore, the correct answer is C.

### NEW QUESTION # 67

An administrator is tasked with making a newly-deployed Prism Central and its associated AHV clusters available to a Project. The administrator created the Nutanix provider account, verified it, added it to the Project, and whitelisted the clusters. Project users are reporting they are unable to deploy marketplace blueprints on the new infrastructure. What should the administrator do?

- A. Add the users to the Consumer role on the new account.
- B. Create a new environment in the Project using the new account.
- C. Make sure the provider service account credentials are correct.
- D. Republish the blueprint to the marketplace.

**Answer: B**

Explanation:

For users to successfully deploy Marketplace Blueprints to a specific infrastructure, the Project must have a configured Environment.

- \* The Gap: Merely adding the Account and whitelisting the Cluster in the Project settings (the "Infrastructure" tab) only authorizes access. It does not tell the Self-Service engine how to use that infrastructure (e.g., which Networks to attach, which Storage Containers to use, or what sizing policies to apply).
- \* The Solution: The administrator must go to the Environmentstab within the Project and Create a New Environment mapped to the new Account and Cluster.
- \* Marketplace Logic: Marketplace blueprints are typically "Environment Agnostic." When a user launches one, they are prompted to select a destination Environment. If no Environment exists for the new cluster, the user cannot select it as a target for deployment.

### NEW QUESTION # 68

An administrator wants to automate the process of restarting a VM whenever it exceeds 90% CPU usage. What steps should the administrator take to implement this automation?

- A. Schedule a Runbook to restart all VMs daily and assign it to a project.
- B. Create a Playbook with an alert-based trigger with an action to reboot the VM.
- C. Configure a Project and set a policy to restart the VM when the CPU quota is exceeded.
- D. Create a Playbook with a manual trigger with an action to reboot the VM.

**Answer: B**

Explanation:

To automate a remediation action (like restarting a VM) based on a specific performance threshold (like CPU usage > 90%), the administrator must use Intelligent Operations (X-Play) with an event-driven trigger.

\* Alert-Based Trigger: The administrator first ensures there is an Alert Policy in Prism Central for "VM High CPU" configured with a threshold of 90%.

\* Playbook Configuration: The administrator then creates a Playbook and selects the Alert trigger (or Alerts Matching Criteria trigger). They link this trigger to the specific CPU alert policy.

\* Action: The administrator adds the VM Reboot (or Power Cycle) action to the Playbook.

\* Result: As soon as the system detects the CPU exceeding 90%, the Alert fires, which immediately triggers the Playbook to reboot the VM without human intervention.

\* Options A (Scheduled) and C (Manual) do not meet the requirement of "whenever it exceeds," which implies real-time reaction. Option B is incorrect because Project Quotas manage resource allocation limits, not runtime performance monitoring or remediation.

### NEW QUESTION # 69

Refer to the exhibit.

A customer has decided to enable Calm Showback feature but started to receive an alert in Prism Central stating that Calm showback is not able to reach beam service.

Which two configuration items should the administrator check to ensure Calm can communicate with Beam?

(Choose two.)

- A. DNS configuration in Prism Central
- B. Ensure Pulse is enabled
- C. Flow is enabled in the same Prism Central
- D. Prism Element is configured with Proxy settings

**Answer: A,D**

Explanation:

The alert in Prism Central indicates that Calm showback is not able to reach the beam service. This could be due to network connectivity issues or incorrect configurations. The administrator should check the DNS configuration in Prism Central (Option A) to ensure that it is correctly configured to allow communication with the Beam service. Additionally, checking if Prism Element is configured with Proxy settings (Option C) is essential as it can also affect the communication between Calm and Beam. Pulse (Option B) and Flow (Option D) are not related to the Calm showback feature and do not impact its functionality.

### NEW QUESTION # 70

An administrator is unable to launch a Calm blueprint (new and old). Launching an existing blueprint under this condition fails with the error message:

The project for this blueprint does not have any associated Nutanix account.

Downloading and uploading the new blueprint also fails with

Launch with Variables' Profile expected to fail as Windows Server VWs attached with deleted Account.

Please modify them to use different account and try again.

Why is the administrator seeing this issue?

- A. The has not been created.
- B. The account is not verified.
- C. The account is in a failed state.
- D. The account been deleted.

**Answer: D**

Explanation:

The error messages indicate that the blueprint is trying to use a Nutanix account that no longer exists. This could happen if the account was deleted by another administrator or by a playbook action. The administrator should check the project settings and

verify that the Nutanix account is still available and associated with the project. If not, the administrator should create a new account or use an existing one and update the blueprint accordingly.
