WGU Practical Applications of Prompt QFO1 Sample Questions (Q13-Q18):

NEW QUESTION # 13

A person wants to use an AI model to predict the winner of an athletic event. The person repeatedly prompts the model until it chooses the person's favorite athlete as the winner. What is the type of bias described in the scenario?

- A. Confirmation bias
- B. Measurement bias
- C. Algorithmic bias
- D. Sampling bias

Answer: A

Explanation:

This scenario is a textbook example of Confirmation bias. Unlike other biases that reside within the data or the algorithm, confirmation bias is a cognitive bias on the part of the user. It occurs when a person searches for, interprets, or prioritizes information in a way that confirms their pre-existing beliefs or desires. By repeatedly prompting the AI until it provides the "desired" answer, the user is disregarding all previous outputs that contradicted their preference.

In the context of prompt engineering, confirmation bias can lead to "leading prompts" where the user subconsciously (or consciously) steers the AI toward a specific conclusion (e.g., "Tell me why Athlete X is the best"). This undermines the AI's value as an objective tool for analysis. To mitigate this, prompt engineers should practice "neutral prompting" and seek to explore multiple perspectives (using techniques like Tree of Thought) rather than hunting for a specific output. Failing to recognize confirmation bias can lead to poor decision-making and the creation of "echo chambers" where AI is used to justify subjective opinions rather than uncover objective truths.

NEW QUESTION # 14

Which strategy is effective for a company to promote the ethical use of AI?

- A. Require employees to use an AI model to make a decision for any ethical dilemma
- B. Encourage users to ethically evaluate AI responses using their personal data
- C. Use an AI system to evaluate job applicants based on fair and ethical criteria
- D. Foster collaboration among diverse stakeholders to address ethical challenges

Answer: D

Explanation:

The most effective strategy for promoting ethical AI is to foster collaboration among diverse stakeholders.

Ethics in AI is not a purely technical problem that can be "solved" with code; it is a socio-technical challenge that requires input from various perspectives, including ethicists, legal experts, social scientists, engineers, and, most importantly, the communities affected by the AI.

Diverse collaboration helps identify "blind spots" that a homogenous technical team might miss. For example, a developer might not realize that a specific data feature is a proxy for race or gender, but a sociologist or a community advocate might recognize it immediately. By bringing these voices together, a company can develop "Ethics by Design" frameworks that proactively address bias, transparency, and safety issues before the AI is deployed. This approach aligns with the principle of "Multidisciplinary Oversight," ensuring that the AI's goals are aligned with human values. Relying purely on the AI to solve its own ethical dilemmas (Option A) is dangerous, as the AI lacks a true moral compass. Instead, human-led collaboration ensures that technology remains a servant to societal well-being.

NEW QUESTION # 15

The prompt, "Give me ideas for a birthday party," is created by a parent to help plan for an upcoming birthday party. Which change helps refine the prompt?

- A. Give the full name of the child
- B. Indicate how soon a response is needed
- C. Explain why the party is being thrown
- D. Indicate the size of the party

Answer: D

Explanation:

Refining a prompt involves adding constraints that narrow the range of possibilities to better fit the user's practical reality. Indicating the size of the party is a high-value refinement because it fundamentally changes the nature of the suggestions the AI will generate.

Planning a party for five children at home is a radically different logistics task than planning a party for 50 people at a rented venue. By adding the party size, the AI can filter out suggestions that are physically or financially impractical. For example, if the size is "small/intimate," the AI might suggest DIY crafts or board games. If the size is "large"

/corporate," it might suggest catering options and venue rentals. While knowing "why" the party is thrown (Option A) provides some context, the "how many" (Option B) is a concrete constraint that dictates the feasibility of all subsequent ideas. Providing a child's full name (Option D) is a privacy risk and provides zero functional value to the AI's creative process. Effective refinement focusing on scale and constraints ensures that the AI's output is actionable rather than just imaginative.

NEW QUESTION # 16

A person asks a large language model to develop a product description for a laptop. The person refines the prompt several times, each time adding more details, context, and restrictions to improve the result. Which prompting technique is described?

- A. Cognitive verifier pattern
- B. Few-shot
- C. Chain of thought (COT)
- **D. Least to most**

Answer: D

Explanation:

The scenario describes Least to most prompting. This technique involves breaking down a complex task into smaller, manageable sub-problems and solving them sequentially. In this case, the user starts with a basic request and progressively adds layers of complexity—details, context, and restrictions—to guide the AI toward a sophisticated final output. It is essentially a strategy of "building up" the prompt complexity until the model has enough specific information to meet the high-level requirement.

Unlike "Chain of Thought" (COT), which focuses on the AI showing its internal reasoning steps for a single logic problem, "Least to most" is about the user-led structural decomposition of a task. It is highly effective for creative or technical writing where a "zero-shot" (single try) approach often yields generic results. By refining the prompt iteratively, the user ensures the AI understands each constraint before moving to the next level of detail. In practical applications, this technique is used to "warm up" the model's context window with specific domain data, ensuring that by the time the final description is generated, the AI is fully aligned with the technical specs and brand voice required for the laptop.

NEW QUESTION # 17

A lawyer needs to interact with a database to search for cases relating to college admissions. What is a benefit of writing effective prompts when interacting with the database?

- A. Greater capacity for unstructured data storage
- B. Data modification for improved applicability
- C. Automatic expansion to include more data
- **D. Prevention of sifting through irrelevant results**

Answer: D

Explanation:

For professionals dealing with vast amounts of specialized information, such as lawyers, the primary benefit of effective prompt engineering is the prevention of sifting through irrelevant results. Legal databases are massive, containing millions of precedents, statutes, and opinions. A vague prompt like "Find cases about schools" would return thousands of results, most of which would be useless to a specific case regarding college admissions.

By using specific keywords, Boolean logic, and contextual constraints within the prompt (e.g., "Search for U.S. Supreme Court cases from 2000-2023 specifically addressing affirmative action in private university undergraduate admissions"), the lawyer drastically narrows the search field. This precision is the essence of effective prompting in a professional environment. It saves significant time and cognitive energy by ensuring that the AI or search algorithm acts as a high-resolution filter. This "signal-to-noise" optimization allows the professional to focus on the high-value task of legal analysis rather than the low-value task of manual data sorting. Effective prompts turn a mountain of data into a curated list of relevant evidence.
