25 VMs are running on a Hyper-V platform at a remote office (ROBO). The administrator has been tasked with setting up replication to the main office (HQ) so it can act as the disaster recovery site. The available bandwidth is 20 Mbps. RPO is set to four hours and the data generated for the interval is 100 GB. Which of the following will achieve the RPO?

- A. Use replication jobs with copy mode set to "interval copy". Schedule to run every four hours.
- B. Use replication jobs with copy mode set to "periodic copy" and copy every four hours.
- C. Configure the replication jobs to use WAN acceleration. Set the schedule to run every four hours.
- D. Configure the replication jobs with traffic throttling to 10 Mbps to limit the impact. Schedule to run every four hours.

Answer: C

Explanation:

There is no mention of "interval copy" in the documentation. Additionally, the amount of data to be processed in the amount of time is not possible without WAN accelerators: 4 hours = 14400 seconds 20Mbps = ~2.5MB/s Max datatransfer would be 14400 x

2.5 = 36000MB Required transfer is 102400MB

Which two environments can Veeam Agents back up? (Choose two.)

- A. FreeBSD
- **B. Ubuntu**
- C. iOS
- **D. Windows Server**
- E. IBM iSeries

Answer: B,D

Explanation:

These agents ensure that data on servers running these operating systems can be effectively backed up and restored. However, Veeam Agents do not support FreeBSD, IBM iSeries, or iOS as these platforms require different backup solutions or are not typically used in environments where Veeam operates.

- A. Advanced Exchange Backup
- B. Exchange Processing
