Fortinet FCP - Azure Cloud Security 7.4 Administrator Sample Questions (Q73-Q78):

NEW QUESTION # 73
Refer to the exhibit.
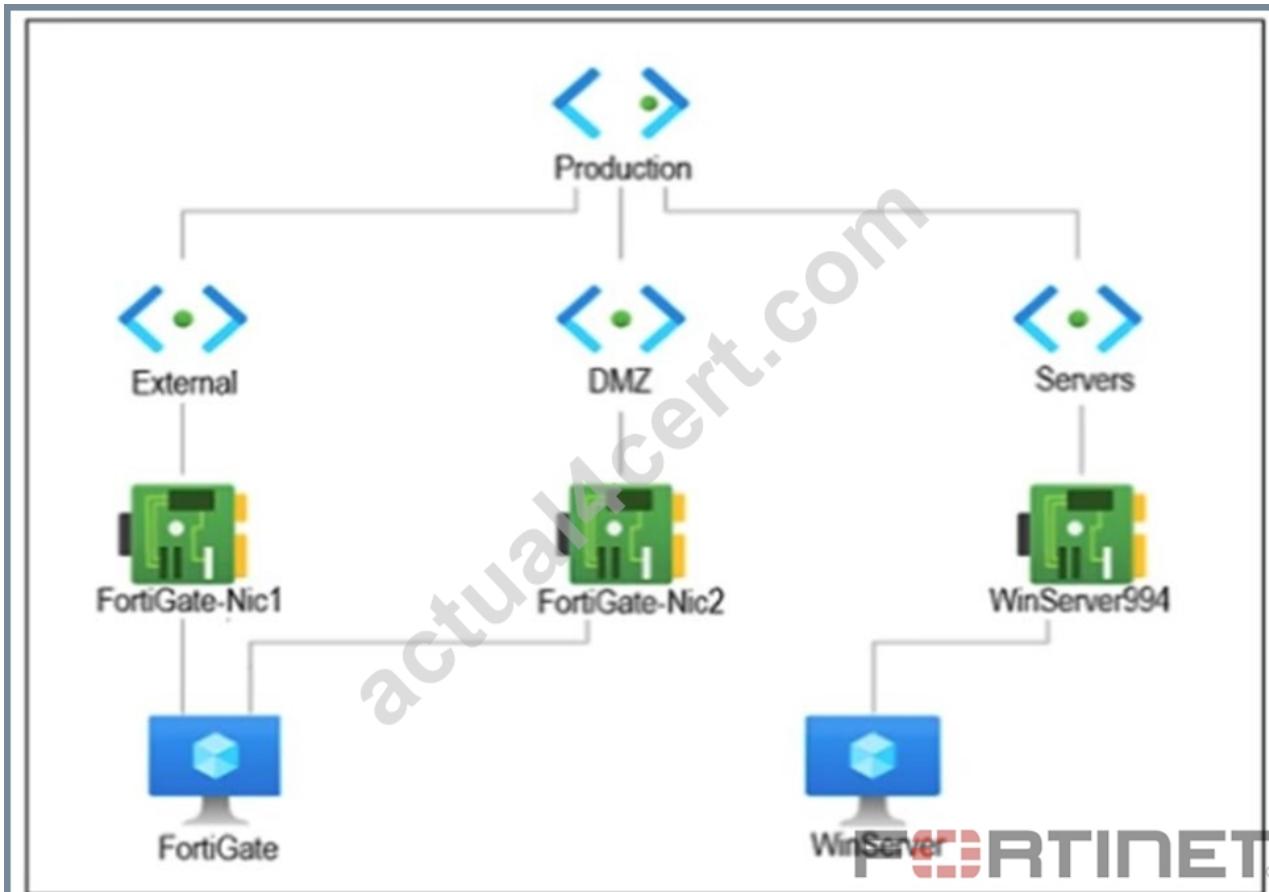

You are troubleshooting a network connectivity issue between two VMs that are deployed in Azure.

One VM is a FortiGate that has one interface in the DMZ subnet, which is in the Production VNet. The other VM is a Windows Server in the Servers subnet, which is also in the Production VNet. You cannot ping the Windows Server from the FortiGate VM. What is the reason for this?

- A. The firewall in the Windows VM is blocking the traffic
- B. By default, Azure does not allow ICMP traffic between subnets
- C. You have not configured a user-defined route for this traffic
- D. You have not created a VPN to allow traffic between those subnets

Answer: A

Explanation:
The FortiGate VM and the Windows Server VM are in different subnets but within the same Production virtual network, which means they can communicate by default unless restricted. Azure allows ICMP between subnets, but Windows VMs have ICMP blocked by default in their firewall settings. Therefore, the likely reason for the ping failure is that the Windows Server's firewall is blocking ICMP (ping) traffic.

NEW QUESTION # 74
Refer to the exhibit.
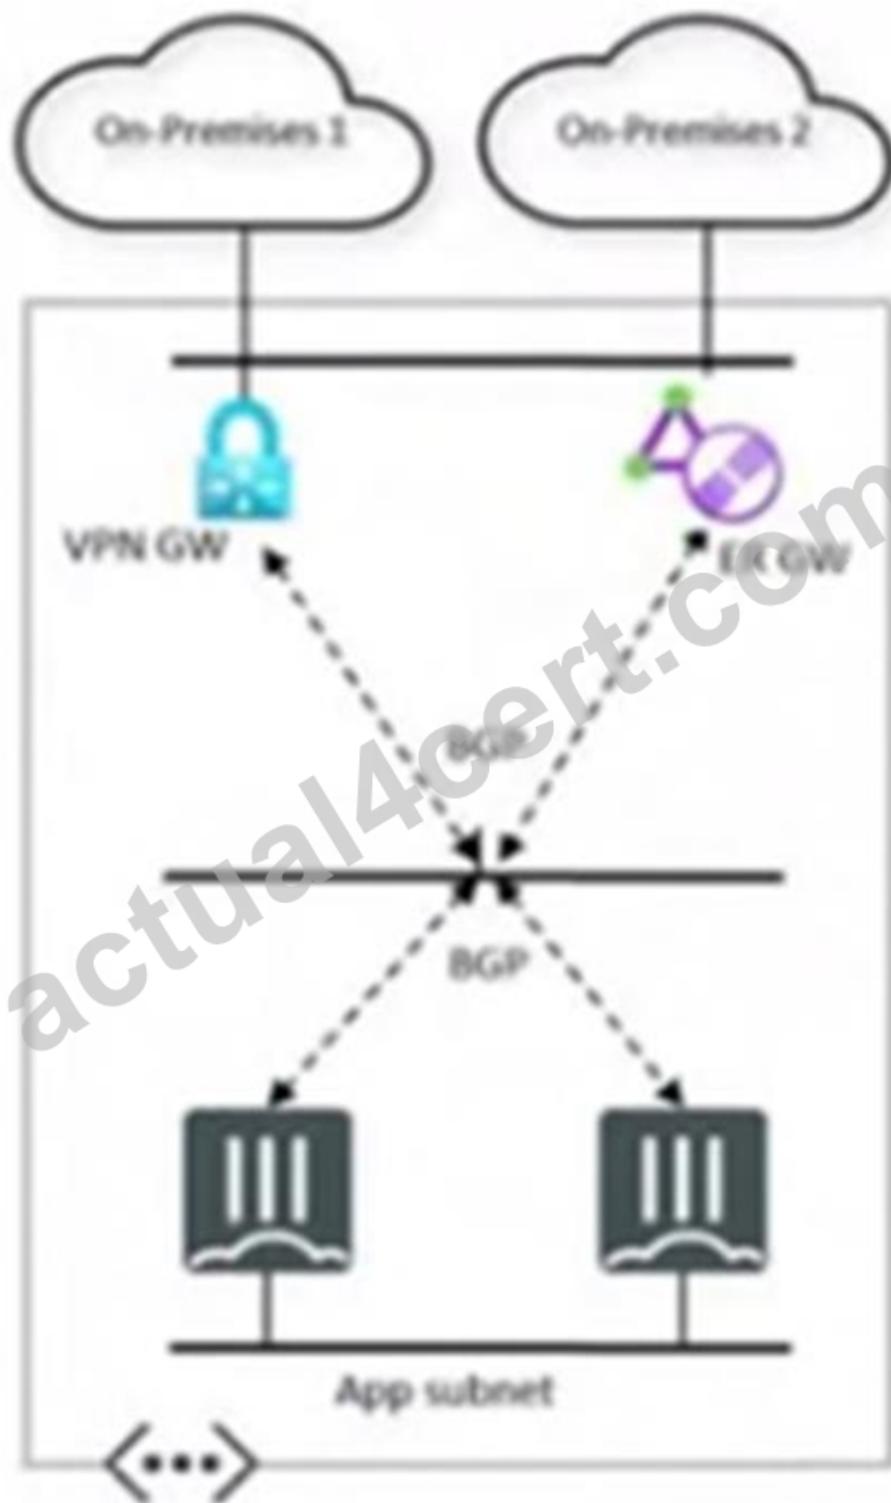

In an expanding corporation, the different branches share resources connecting to Azure through Azure VPN Gateway and ExpressRoute Gateway.

Which Azure solution can you implement to simplify and centralize the seamless sharing of the dynamic routing between FortiGate VMs and branches?

- A. Azure Route Server
- B. Azure Virtual WAN
- C. Azure Virtual Hub
- D. Azure Traffic Manager

Answer: A

Explanation:
Azure Route Server simplifies dynamic routing by allowing your FortiGate VMs to exchange BGP routes directly with Azure's networking fabric. This eliminates the need to manually update route tables and enables seamless, centralized communication between on-premises branches and Azure resources through both VPN Gateway and ExpressRoute Gateway.
