## Adobe AD0-E724 Question Explanations, AD0-E724 Exam Exercise

No matter you are exam candidates of high caliber or newbies, our Adobe AD0-E724 exam quiz will be your propulsion to gain the best results with least time and reasonable money. Not only because the outstanding content of Commerce Developer Professional AD0-E724 Real Dumps that produced by our professional expert but also for the reason that we have excellent vocational moral to improve our Commerce Developer Professional AD0-E724 learning materials quality.

## Adobe Commerce Developer Professional Sample Questions (Q70-Q75):

### NEW QUESTION # 70

An Adobe Commerce developer is asked to implement a 15% surcharge for all users from a 'Wholesale' customer group. Keeping best practices in mind, what is a correct to accomplish this?

- A. Create an Observer to the `cataiog_product_get_final_price` event. Check if the current customer is in the 'Wholesale' group, and if so, retrieve the product from the `$observer->getEventC)` data and Call `$product->setData('final_price', $product->getData( 'final_price') * 1.15)`.
- B. Create a Cart Price Rule that applies only to the 'Wholesale' group. Specify no conditions for the rule, and in the Actions section, specify for the rule to apply a "Percent of product price discount", with the 'Discount Amount' field set to -15.
- C. Declare a new total collector class to calculate the modified total if the current user is in the group, register it in the module's `etc/sales .xml` file, modify the `checkout_cart_index.xml` and `checkout_index_index.xml` layouts to include a new child in the totals block.

**Answer: C**

Explanation:

The best practice to add a surcharge in Magento is to create a custom total collector that calculates and applies the surcharge. This approach integrates smoothly with Magento's sales and checkout processes.

\* Total Collector for Surcharge:

\* Creating a new total collector class allows Magento to calculate a custom surcharge and display it in the appropriate sections of the checkout and order summaries.

\* Registering this in etc/sales.xml ensures that Magento includes this total during order processing and ensures it's displayed properly on the frontend and backend.

\* Why Option A is Correct:

\* This approach follows Magento's framework for managing additional charges. It ensures the surcharge is correctly applied and displayed.

\* Options B and C involve less maintainable and less integrated approaches. Option B misuses a Cart Price Rule, and Option C uses an observer, which does not fit well with Magento's total calculation architecture.

### NEW QUESTION # 71

In which two directories are third-party modules located by default? (Choose two.)

- A. app/modules/
- **B. vendor/**
- **C. app/code/**
- D. app/packages/

**Answer: B,C**

Explanation:

By default, third-party modules are located in vendor/ or app/code/ directories. The vendor/ directory contains modules that are installed using Composer, while the app/code/ directory contains modules that are manually copied or cloned from a repository. Third-party modules in Magento 2 are typically located in two directories by default: the vendor/ directory and the app/code/ directory. The vendor/ directory is used for modules that are installed via Composer, Magento's dependency manager, which includes both Magento's core modules and third-party modules. The app/code/ directory is used for custom modules developed specifically for the project or for third-party modules that are manually installed without Composer. These conventions provide a structured approach to managing Magento modules, whether they are part of Magento's core functionality, contributed by the community, or developed for specific projects.

### NEW QUESTION # 72

The value of a product attribute in the Adobe Commerce system needs to have a different format before it is displayed. Which attribute model class is responsible for this?

- A. Source
- B. Backend
- **C. Frontend**

**Answer: C**

Explanation:

The frontend attribute model class is responsible for formatting the value of a product attribute before it is displayed on the storefront. This class can implement methods such as getValue, getLabel, getInputType, and getOptionText to modify the attribute value.

The backend attribute model class is responsible for saving and loading the attribute value to and from the database. The source attribute model class is responsible for providing the list of options for an attribute.

Verified References: [Adobe Commerce Developer Guide - Attribute models] In Adobe Commerce (Magento 2), the formatting of product attribute values before they are displayed is handled by the attribute's frontend model. The frontend model, typically extending

\Magento\Eav\Model\Entity\Attribute\Frontend\AbstractFrontend, is responsible for preparing the attribute value for display in the frontend, including formatting dates, adding pricing structures, and more.

The backend model deals with saving and loading attribute data, while the source model provides options for select attributes.

### NEW QUESTION # 73

An Adobe Commerce developer is being tasked with creating a new cron job to run a method that has already been written. What are the minimally required steps to accomplish this?

- A. Create a crontab.xml file and set a schedule for the new cron job.
- B. Create crontab.xml and cron\_groups.xml files to assign the new job to a cron group.
- C. Create a crontab.xml file and a new system configuration in system.xml for the schedule.

**Answer: A**

Explanation:

According to the Configure and run cron guide for Magento 2 developers, the crontab.xml file is used to declare and configure cron jobs for a module. The file should specify the name, instance, method and schedule of the cron job. Therefore, creating a crontab.xml file and setting a schedule for the new cron job are the minimally required steps to accomplish this task. Verified

References: <https://devdocs.magento.com/guides>

/v2.3/config-guide/cli/config-cli-subcommands-cron.html

To set up a new cron job in Adobe Commerce, you need to define it in the crontab.xml file. This file is essential to schedule cron tasks and is all that's required for simple cron job configurations. You specify the cron job schedule, method, and class in this file.

Here's a minimal example of crontab.xml:

```
<?xml version="1.0"?>
```

```
<config
```

```
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:noNamespaceSchemaLocation="urn:
```

```
magento:module:Magento_Cron:etc/crontab.xsd"
```

```
>
```

```
<group id="default">
```

```
<job name="your_custom_cron_job" instance="Vendor\Module\Cron\YourJob" method="execute">
```

```
<schedule>0 * * * * </schedule> <!-- Runs every hour -->
```

```
</job>
```

```
</group>
```

```
</config>
```

\* group id: This specifies the cron group; "default" is commonly used, but you can define custom groups in cron\_groups.xml if necessary.

\* job: Defines the cron job, with name, instance (path to the class), and method attributes.

\* schedule: Uses standard cron expressions to specify the frequency.

Additional Resources:

\* Adobe Commerce Developer Guide: Cron Jobs

\* Magento 2 Crontab XML Configuration

### NEW QUESTION # 74

A merchant of an Adobe Commerce Cloud project wants to setup one of their websites using a subdomain.

The merchant is considering the domain to be set as secondstore.example.com

In addition to editing the magento-vars.php file, and apply a domain check and set \$\_SERVER

["MAGE\_RUN\_CODE"] and \$\_SERVER["MAGE\_RUN\_TYPE"].

What file is required to perform this action?

- A. Configure secondstore.example.com subdomain route in NGINX virtual-host configuration file.
- B. Configure secondstore.example.com subdomain route in .magento/services.yaml.
- C. Configure secondstore.example.com subdomain route in .magento/routes.yaml.

**Answer: C**

Explanation:

In Adobe Commerce Cloud, routing configurations for custom domains and subdomains are managed within the .magento/routes.yaml file. This file defines how requests are directed to the application and is essential for setting up different stores or websites with unique subdomains.

\* Using .magento/routes.yaml for Subdomain Configuration:

\* To set up a new subdomain, like secondstore.example.com, you need to configure the route in .

magento/routes.yaml. This file handles all routing and domain configurations for Adobe Commerce Cloud projects.

\* Why Option C is Correct:

\* .magento/routes.yaml is designed specifically for defining routing rules, including subdomains, making it the appropriate choice for this task.

\* Option A (NGINX configuration) and Option B (.magento/services.yaml) are not correct because they don't directly manage domain routing in Adobe Commerce Cloud.

\* Example Configuration:

http://secondstore.example.com/:

type: upstream

upstream: "mymagento:80"

## NEW QUESTION # 75

.....

This is a desktop-based exam simulator software. The user can easily get used to its format and it is compatible with Windows. It has a bank of the actual Commerce Developer Professional (AD0-E724) exam questions, going through them will prove to be vital for your Adobe AD0-E724 exam preparation since a candidate must know his lacking points. The AD0-E724 Practice Exam simulator is reliable because its Adobe AD0-E724 exam questions have been compiled by experts and you can be sure of their validity and accuracy. All features of the web-based practice exam are present in this software.
