## CompTIA Advanced Security Practitioner (CASP+) Exam Sample Questions (Q288-Q293):

### NEW QUESTION # 288

All staff at a company have started working remotely due to a global pandemic. To transition to remote work, the company has migrated to SaaS collaboration tools. The human resources department wants to use these tools to process sensitive information but is concerned the data could be:

Leaked to the media via printing of the documents

Sent to a personal email address

Accessed and viewed by systems administrators

Uploaded to a file storage site

Which of the following would mitigate the department's concerns?

- A. Data loss detection, reverse proxy, EDR, and PGP
- **B. VDI, proxy, CASB, and DRM**
- C. Proxy, secure VPN, endpoint encryption, and AV
- D. Watermarking, forward proxy, DLP, and MFA

**Answer: B**

Explanation:

VDI (virtual desktop infrastructure), proxy, CASB (cloud access security broker), and DRM (digital rights management) are technologies that can mitigate the concerns of processing sensitive information using SaaS (software as a service) collaboration tools. VDI is a technology that provides virtualized desktop environments for users that are hosted and managed by a central server, allowing users to access applications or data from any device or location. VDI can prevent data leakage to the media via printing of documents, as it can restrict or monitor the printing capabilities or permissions of users or devices. Proxy is a technology that acts as an intermediary between clients and servers, filtering or modifying web traffic based on predefined rules or policies. Proxy can prevent data leakage to a personal email address, as it can block or redirect web requests to unauthorized or untrusted email domains or services. CASB is a technology that provides visibility and control over cloud services or applications, enforcing security policies or compliance requirements based on predefined rules or criteria. CASB can prevent data access and viewing by systems administrators, as it can encrypt or mask sensitive data before it reaches the cloud provider or application, making it unreadable or inaccessible by unauthorized parties. DRM is a technology that restricts the access, use, modification, or distribution of digital content or devices, enforcing the rights and permissions granted by the content owner or provider to authorized users or devices. DRM can prevent data upload to a file storage site, as it can limit or disable the copying, sharing, or transferring capabilities or permissions of users or devices. Verified References:

### NEW QUESTION # 289

As part of its risk strategy, a company is considering buying insurance for cybersecurity incidents.

Which of the following BEST describes this kind of risk response?

- A. Risk rejection
- B. Risk mitigation
- **C. Risk transference**
- D. Risk avoidance

**Answer: C**

### NEW QUESTION # 290

A penetration tester obtained root access on a Windows server and, according to the rules of engagement, is permitted to perform post-exploitation for persistence.

Which of the following techniques would BEST support this?

- **A. Creating a backdoor**
- B. Moving laterally to a more authoritative server/service
- C. Exploiting an arbitrary code execution exploit
- D. Configuring systemd services to run automatically at startup

**Answer: A**

Explanation:

A reverse shell is not technically considered a "backdoor", but installation of a modified (backdoor) service could reestablish connection in the event of disconnection.

#### **NEW QUESTION # 291**

A Chief Information Security Officer (CISO) is concerned that a company's current data disposal procedures could result in data remanence. The company uses only SSDs. Which of the following would be the MOST secure way to dispose of the SSDs given the CISO's concern?

- A. Overwriting
- B. Degaussing
- C. Formatting
- **D. Shredding**
- E. Incinerating

**Answer: D**

Explanation:

Shredding is the most secure way to dispose of the SSDs given the CISO's concern. Shredding involves physically destroying the SSDs by cutting them into small pieces that make the data unrecoverable. Shredding is the ultimate data destruction method for both HDDs and SSDs, as it ensures that no data remanence is left on the media.

#### **NEW QUESTION # 292**

A company wants to reduce its backup storage requirement and is undertaking a data cleanup project. Which of the following should a security administrator consider first when determining which data should be deleted?

- A. Data labels
- **B. Retention schedules**
- C. Sanitization requirements
- D. Classification levels
- E. File size

**Answer: B**

Explanation:

Before determining which data should be deleted during a data cleanup project, it is critical to first review retention schedules. Retention schedules specify how long data must be retained to comply with legal, regulatory, or business requirements. Deleting data prematurely could result in non-compliance or the loss of important information. By consulting retention schedules, the security administrator ensures that data is deleted in a compliant and controlled manner, based on its retention policy.
