Resource pooling - Answer-Characteristic that allows the cloud provider to meet various demands from customers while remaining financially viable.

measured/metered service - Answer-The customer is charged for only what they use and nothing more.

Business Impact Analysis (BIA) - Answer-An assessment of the priorities given to each asset and process within the organization

Elasticity - Answer-This is the flexibility of allocating resources as needed for immediate usage, instead of purchasing resources according to other variables.

Simplicity - Answer-Usage and administration of cloud services ought to be transparent to cloud customers and users; from their perspective, a digital data service is paid for and can be used, with very little additional input other than what is necessary to perform their duties.

Scalability - Answer-The organization's computing needs won't remain static; there will be new (and hopefully more) users, customers, and data as the organization continually matures.

Infrastructure as a Service (IaaS) - Answer-The most basic of cloud service offerings, <blank> allows the customer to install all software, including operating systems (OSs) on hardware housed and connected by the cloud vendor.

Platform as a Service (PaaS) - Answer-<Blank> contains everything included in IaaS, with the addition of OSs.

Software as a Service (SaaS) - Answer-The cloud vendor becomes responsible for administering, patching, and updating software as well.

## WGU Managing Cloud Security (JY02) Sample Questions (Q62-Q67):

### NEW QUESTION # 62

After creating a backup set, an engineer stores the backups according to company policy. Which action should the engineer take periodically to ensure the backed-up data is viable?

- A. The engineer should test the backups according to company policy.
- B. The engineer should replace the old backups with newer ones.
- C. The engineer should compare the old backups with newer ones.
- D. The engineer should delete backups according to company policy.

**Answer: A**

Explanation:

Backups are only valuable if they can be successfully restored when needed. Testing backups on a periodic basis is the only reliable way to validate their viability. Simply storing backups without testing may create a false sense of security, because corruption, misconfiguration, or incomplete backup sets can go unnoticed until a disaster occurs.

Industry best practices, such as those recommended by NIST and ISO 27031, emphasize regular backup testing as part of disaster recovery and business continuity planning. Testing involves restoring data to a test environment, verifying its integrity, and ensuring that applications can use the restored data as expected.

Deleting, comparing, or replacing backups might help in managing storage efficiency, but these actions do not confirm whether the backups are usable. Periodic testing ensures alignment with company policy, regulatory requirements, and internal risk management controls. It also provides confidence to management that recovery objectives, such as RTO (Recovery Time Objective) and RPO (Recovery Point Objective), can be met.

### NEW QUESTION # 63

Which legal framework is concerned with the privacy of data of EU/EEA citizens?

- A. HIPAA
- B. APPI
- C. GDPR
- D. COPPA

**Answer: C**

Explanation:

The General Data Protection Regulation (GDPR) is the legal framework concerned with the privacy of data belonging to citizens of the European Union and the European Economic Area (EU/EEA). Managing Cloud principles explain that GDPR establishes comprehensive rules governing the collection, processing, storage, and transfer of personal data.

GDPR applies to organizations both within and outside the EU/EEA if they process personal data of EU residents. It enforces strict requirements related to data protection, consent, breach notification, and individual rights. Cloud service providers and consumers must ensure compliance when handling EU personal data.

The other options apply to different jurisdictions or data types. HIPAA governs healthcare data in the United States, COPPA protects children's online privacy in the U.S., and APPI applies to Japan. Therefore, GDPR is the correct framework.

### NEW QUESTION # 64

Which design pillar encompasses the ability to support development and run workloads effectively, gain insights into operations, and continuously improve supporting processes to deliver business value?

- A. Reliability
- B. Operational excellence

- C. Performance efficiency
- D. Sustainability

**Answer: B**

Explanation:

The Operational Excellence pillar emphasizes practices that allow organizations to develop, deploy, and operate workloads effectively. It includes monitoring operations, responding to incidents, and continuously improving processes. By embedding feedback loops, organizations enhance agility and ensure that technology supports business value.

Performance efficiency deals with using computing resources efficiently, reliability ensures system availability, and sustainability focuses on environmental responsibility. While important, these do not encompass the process-driven improvements at the heart of operational excellence.

Operational excellence ensures that organizations can adapt quickly to changes, implement automation, and drive consistent improvements across cloud workloads. It is a key principle in cloud frameworks like AWS Well-Architected, Microsoft CAF, and Google's Reliability Engineering practices.

#### **NEW QUESTION # 65**

Which cloud model is owned and operated by a vendor and then sold, leased, or rented to someone else?

- **A. Public**
- B. Hybrid
- C. Private
- D. Community

**Answer: A**

Explanation:

The Public cloud model is owned and operated by a vendor and offered to customers through sale, lease, or rental arrangements.

Managing Cloud principles describe public cloud providers as entities that deliver shared infrastructure, platforms, or applications to multiple customers over the internet.

In this model, the cloud service provider manages the infrastructure, maintenance, and security of the environment, while customers consume services on a pay-as-you-go or subscription basis. Public clouds offer scalability, flexibility, and cost efficiency but provide less control over underlying systems.

Private clouds are dedicated to a single organization, hybrid clouds combine multiple models, and community clouds serve specific groups. Therefore, the public cloud model best fits the description.

#### **NEW QUESTION # 66**

Which element should a company implement when looking to provide the most secure foundation and smallest attack footprint for virtual servers?

- A. Application isolation
- B. Type 2 hypervisor
- **C. Type 1 hypervisor**
- D. Application virtualization

**Answer: C**

Explanation:

A Type 1 hypervisor provides the most secure foundation and smallest attack footprint for virtual servers.

Managing Cloud documentation explains that Type 1 hypervisors run directly on the host hardware without an underlying operating system.

By eliminating the host OS layer, Type 1 hypervisors reduce attack surface and improve isolation between virtual machines. This architecture enhances performance, stability, and security, making it the preferred choice for enterprise and cloud environments.

Type 2 hypervisors run on top of a host operating system, increasing complexity and vulnerability exposure.

Application isolation and virtualization do not provide the same foundational security. Therefore, a Type 1 hypervisor is the correct choice.
