Pure Storage Pure Certified Portworx Enterprise Professional (PEP) Exam Sample Questions (Q70-Q75):

NEW QUESTION # 70

How would an administrator schedule automatic backups of a volume using Portworx?

- **A. Configure and apply schedule policies.**
- B. Use a cron job to execute pxctl snapshot create.
- C. Execute px backup volume.

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Portworx provides a declarative method to schedule automatic backups by configuring schedule policies within its Backup and DR framework. These policies specify when and how frequently backups should occur, retention rules, and target storage locations. By applying schedule policies, administrators enable Portworx to perform backups automatically without manual intervention or external scripting. Using cron jobs to run pxctl snapshot create is possible but less integrated, error-prone, and not recommended for scalable environments. The command px backup volume is not a valid Portworx CLI command. The Portworx backup documentation encourages using native schedule policies for reliable, maintainable, and policy-driven backup automation, supporting compliance and disaster recovery strategies **【Pure Storage Portworx Backup Guide source】** .

NEW QUESTION # 71

When updating the Portworx StorageCluster object to mount the SSL certificate secret, which path should be specified for the AWS_CA_BUNDLE environment variable?

- A. /etc/pwx/objectstore-cert/px-s3-certs
- **B. /opt/certs/objectstore.pem**
- C. /etc/pwx/objectstore-cert/objectstore.pem

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

When configuring Portworx to communicate securely with an AWS S3-compatible Object Store using custom SSL certificates, the AWS_CA_BUNDLE environment variable must point to the mounted certificate file location. The correct path for this in the StorageCluster spec is /opt/certs/objectstore.pem. This file contains the Certificate Authority (CA) bundle trusted by Portworx to validate TLS connections to the object store. Ensuring this path is correctly specified and the certificate secret properly mounted is critical to prevent TLS handshake failures and enable secure communication. Portworx documentation and configuration samples specify /opt/certs/objectstore.pem as the standard path for the CA bundle within Portworx containers when integrating with custom

or private certificate authorities **【Pure Storage Portworx Security Guide source】** .

NEW QUESTION # 72

What information is included in the Portworx diagnostics bundle (diags)?

- A. Application logs, Kubernetes events, and network configurations
- B. User activity logs, security policies, and firewall rules
- **C. Portworx journal logs, CLI command outputs, and basic OS information**

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The Portworx diagnostics bundle, known as "diags," aggregates comprehensive diagnostic data for troubleshooting. This includes Portworx journal logs, which record detailed system and service events essential for identifying errors or malfunctions. Additionally, the bundle contains outputs from key CLI commands such as `pxctl status` and `pxctl volume list` that provide snapshots of the cluster's health, volume states, and configuration at the time of collection. Basic operating system information, including kernel version, disk hardware details, and network interfaces, is also captured to understand the underlying environment. Together, these components equip Portworx support and administrators with the contextual data needed for effective root cause analysis and faster issue resolution. The official Portworx support documentation recommends collecting and submitting this bundle for all significant troubleshooting cases as it expedites problem diagnosis and resolution **【Pure Storage Portworx Support Guide source】** .

NEW QUESTION # 73

What configuration steps should a Portworx Administrator perform to ensure that Portworx can use the S3 Object Store using a custom/3rd party (not signed by public CA) certificate?

- **A. Create a Kubernetes secret containing the certificate and reference it in the storagecluster via env variable.**
- B. No additional configuration is necessary.
- C. Create a secret containing the certificate and run `pxctl certificate import` command.

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

When integrating Portworx with an S3 Object Store secured by a custom or third-party certificate that is not signed by a public Certificate Authority (CA), administrators must manually provide the relevant CA certificate to Portworx. This involves creating a Kubernetes secret that contains the custom CA certificate and referencing this secret in the StorageCluster manifest through environment variables. This allows Portworx components to trust the certificate during TLS handshake with the S3 endpoint, avoiding connection failures due to untrusted certificates. Without this step, Portworx cannot securely communicate with the object store. The Portworx security and installation documentation highlights this practice as essential for secure Object Store integration in private or regulated environments where internal or custom PKIs are used **【Pure Storage Portworx Security Guide source】** .

NEW QUESTION # 74

Which two CRDs are required for performing an ApplicationBackup?

- A. BackupLocation and RestoreBackup
- **B. BackupLocation and ApplicationBackup**
- C. ApplicationBackup and migrations

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To perform an ApplicationBackup in Portworx, two Kubernetes Custom Resource Definitions (CRDs) are essential: BackupLocation and ApplicationBackup. The BackupLocation CRD defines the target backup storage, such as an S3 bucket or NFS share, including credentials and endpoints. ApplicationBackup defines the specifics of the backup operation, including which application volumes to back up, schedules, and retention policies. Together, they enable declarative backup management within Kubernetes, allowing administrators to configure, automate, and monitor backups of stateful applications using Portworx. These
