최신 UiPath Automation Business Analyst Associate UiPath-ABAAv1 무료샘플문제 (Q57-Q62):

질문 # 57

What is the role of the Business Analyst during the Business Case and Technical Validation phase of the Implementation Methodology?

- A. Identifies the key complexities, technical dependencies and the access needed
- **B. Validates the business case for the selected use cases for automation and the cost benefits**
- C. Drafts the Process Definition Document
- D. Creates the UAT plan together with the client team

정답: B

설명:

During the Business Case and Technical Validation phase, the Business Analyst (BA) plays a critical role in ensuring that proposed automation opportunities are not only feasible but also beneficial to the organization.

Their primary responsibility is to validate the business case for the selected use cases and analyze the cost-benefit aspect of automating those processes. This means the BA must work closely with stakeholders to quantify potential savings, estimate effort reductions, determine ROI, and compare the current manual process performance against projected automated performance.

The BA evaluates factors such as volume, frequency, time spent, error rates, and the strategic value of automating the process. By doing this, the BA ensures that only high-value and viable processes proceed to the next stage of implementation. This step prevents wasted effort on low-impact or overly complex use cases that do not contribute meaningful business value.

Additionally, the BA collaborates with the Solution Architect to ensure the business and technical perspectives align. The outcome of this phase becomes a key input for prioritizing automation candidates and ensuring that automation initiatives deliver measurable improvements.

질문 # 58

Which document outlines the future state of the process and modules to be developed?

- A. Statement of Work (SOW)
- B. UAT Test Script
- **C. Solution Design Document (SDD)**
- D. Project Charter

정답: C

설명:

The Solution Design Document (SDD) outlines the future state (To-Be) of the business process, including the detailed technical components and modules to be developed. It is a critical output of the Solution Design stage and serves as the blueprint for the development team.

The SDD includes:

- * Automation logic and flow diagrams
- * Breakdown of reusable modules
- * Exception handling logic
- * Integration and system interaction points
- * Technical configurations and assumptions

Prepared primarily by the Solution Architect, the SDD ensures that development follows a clear and consistent direction. It helps prevent misinterpretation of business requirements and facilitates better collaboration among developers, testers, and architects.

질문 # 59

Which of the following teams is highly recommended to be involved early in the implementation process for technical management?

- A. Marketing Team
- **B. Client IT Team**

- C. Human Resources Team
- D. UiPath Customer Support

정답: B

설명:

The Client IT Team is highly recommended to be involved early in the automation implementation process because they own the technical management of the department's software and infrastructure. Their involvement is critical for provisioning access, ensuring network security compliance, setting up environments, and integrating UiPath components (e.g., Orchestrator, Robots, and Studio) with existing systems.

Delays in engaging the Client IT Team can result in project bottlenecks, especially when access to applications or technical support is needed. They also play a crucial role in helping Infrastructure Engineers from the Implementation Team understand the client's IT policies and systems, enabling a smooth technical setup.

Involving them early ensures that infrastructure readiness, access provisioning, and system compatibility are not left to the last minute, reducing risks and enabling a seamless development and deployment experience.

질문 # 60

Which document/app is used to record access required to build the automation and run it in UAT and production?

- A. Access Control Matrix
- B. Process Definition Document
- **C. Application Tracker**
- D. UAT Test Log

정답: C

설명:

The Application Tracker is the document used to record all access requirements needed for the automation project. It includes the details of what access is needed for developers, robots, and testers during development, UAT, and production stages.

Access is one of the most common causes of project delays. Hence, the Application Tracker ensures clear documentation and tracking of which systems need access provisioning, which roles need it, and what level of access is required. It helps prevent last-minute surprises where developers or bots are blocked from interacting with key systems.

By maintaining this centralized record, project managers and infrastructure engineers can coordinate effectively with client IT teams to avoid delays, improve security compliance, and ensure timely availability of required access credentials or accounts.

질문 # 61

Which of the following best describes the Automation Business Analyst's role during the Process Analysis stage?

- A. Approves solution architecture
- B. Defines coding best practices
- C. Handles infrastructure provisioning
- **D. Analyzes the As-Is process and defines the To-Be process**

정답: D

설명:

During the Process Analysis stage, the Automation Business Analyst is responsible for analyzing the current (As-Is) process and defining the future (To-Be) process to be automated. This includes mapping out each step, understanding business rules, identifying inefficiencies, and collaborating with stakeholders to envision how automation will change the process.

The Business Analyst also works closely with the Solution Architect to prepare the Process Definition Document (PDD) and ensures that the process is well-documented for the developers to understand and automate.

This role is essential for bridging the gap between business users and technical implementers, ensuring that the solution reflects the true needs of the business while being technically feasible.
