Hot JN0-336 Questions | Exam JN0-336 Details

Our JN0-336 guide materials are constantly updated. In order to ensure that you can use the latest version as quickly as possible, our professional experts check the JN0-336 exam questions every day for updates. If there is an update system, it will be automatically sent to you. The JN0-336 learning prep you use is definitely the latest information on the market without doubt. And you can enjoy free updates for one year after purchase.

Juniper Security, Specialist (JNCIS-SEC) Sample Questions (Q86-Q91):

NEW QUESTION # 86
Which two features are configurable on Juniper Secure Analytics (JSA) to ensure that alerts are triggered when matching certain criteria? (Choose two.)

- A. events
- B. assets
- C. building blocks
- D. tests

Answer: C,D

Explanation:
Building blocks in JSA are reusable components that define specific attributes or behaviors in the network traffic. They can be used to create complex criteria for alerts. By combining multiple building blocks, you can specify detailed conditions under which alerts should be triggered, such as combinations of events or specific sequences of actions within the network.

Tests in JSA are conditions or rules that analyze log or flow data to detect unusual or malicious activity.

You can configure tests to evaluate the data against predefined criteria, which, when met, will trigger alerts. These tests are essential for identifying potential security incidents and ensuring that relevant alerts are issued in a timely manner.

NEW QUESTION # 87

Click the Exhibit button.

Which two statements about the log output shown in the exhibit are correct? (Choose two)

- A. AppTrack is enabled on the untrust zone.
- B. AppTrack is enabled on the trast zone.
- C. Source NAT is performed
- D. Traffic destined to the HTTP server is placed in an IPsec tunnel

Answer: A,B

NEW QUESTION # 88

You are asked to ensure that if the session table on your SRX Series device gets close to exhausting its resources, that you enforce a more aggress.ve age-out of existing flows.

In this scenario, which two statements are correct? (Choose two.)

- A. The high-watermark configuration specifies the percentage of how much of the session table can be allocated before applying a more aggressive age-out timer
- B. The high-watermark configuration specifies the percentage of how much of the session table is left before disabling a more aggressive age- out timer.
- C. The early-ageout configuration specifies the timeout value, in seconds, that will be applied once the low-watermark value is met.
- D. The early-ageout configuration specifies the timeout value, in seconds, that will be applied once the high-watermark value is met.

Answer: A,D

Explanation:

The early-ageout configuration specifies the timeout value, in seconds, that will be applied once the high- watermark value is met. The high-watermark configuration specifies the percentage of how much of the session table can be allocated before applying a more aggressive age-out timer. This ensures that the session table does not become full and cause traffic issues, and also ensures that existing flows are aged out quickly when the table begins to get close to being full.

NEW QUESTION # 89

When a security policy is modified, which statement is correct about the default behavior for active sessions allowed by that policy?

- A. Only policy changes that involve modification of the action field will cause the active sessions affected by the change to be dropped.
- B. Only policy changes that involve modification of the application will cause the active sessions affected by the change to be dropped.
- C. The active sessions allowed by the policy will continue unchanged.

- D. The active sessions allowed by the policy will be dropped.

Answer: C

Explanation:
When you modify a security policy on the SRX Series device, the default behavior is that the existing sessions that match the policy will continue unchanged. This means that the policy modification will only affect new sessions that are initiated after the change. However, you can change this behavior by using the clear-policy-session command, which will clear all the sessions that match the modified policy and force them to re-evaluate the new policy. Reference: = JNCIS-SEC Certification, Open Learning - Security, Specialist (JNCIS-SEC), Security Policies (Advanced)

NEW QUESTION # 90
You are implementing an SRX Series device at a branch office that has low bandwidth and also uses a cloud-based VoIP solution with an outbound policy that permits all traffic.
Which service would you implement at your edge device to prioritize VoIP traffic in this scenario?

- A. AppQoS
- B. AppQoE
- C. SIP ALG
- D. AppFW

Answer: A

Explanation:
The service that you would implement at your edge device to prioritize VoIP traffic in this scenario is AppQoS. AppQoS is a feature that enables you to allocate bandwidth and prioritize traffic based on application signatures or custom rules. AppQoS can enhance the quality of service and experience for critical or latency-sensitive applications, such as VoIP. You can configure AppQoS policies to assign different classes of service (CoS) values or queue numbers to different applications or traffic flows. You can also define bandwidth limits, guarantees, or bursts for each class or queue. Reference: =
