Although it is not an easy thing for somebody to pass the exam, DumpsValid can help aggressive people to achieve their goals. More qualified certification for our future employment has the effect to be reckoned with, only to have enough qualification certifications to prove their ability, can we win over rivals in the social competition. So the CV0-004 Certification has also become more and more important for all people. Because a lot of people long to improve themselves and get the decent job. In this circumstance, more and more people will ponder the question how to get the CV0-004 certification successfully in a short time.

Are you worried about insufficient time to prepare the exam? Do you have a scientific learning plan? Maybe you have set a series of to-do list, but it's hard to put into practice for there are always unexpected changes during the CV0-004 exam. Here we recommend our CV0-004 test prep to you. With innovative science and technology, our study materials have grown into a powerful and favorable product that brings great benefits to all customers. Under the support of our CV0-004 Study Materials, passing the CV0-004 exam won't be an unreachable mission.

## CompTIA Cloud+ (CV0-004) Certification Exam Sample Questions (Q174-Q179):

### NEW QUESTION # 174

A company wants to use a solution that will allow for quick recovery from ransomware attacks, as well as intentional and unintentional attacks on data integrity and availability. Which of the following should the company implement that will minimize administrative overhead?

- A. Data replication
- B. Object versioning
- C. Volume snapshots
- D. Off-site backups

**Answer: C**

Explanation:

Implementing volume snapshots is an effective solution for quick recovery from ransomware attacks and protecting data integrity and availability. Snapshots capture the state of a storage volume at a point in time and can be used to restore data quickly with minimal administrative overhead. References: Data protection strategies like volume snapshots are discussed under cloud data management and protection in the CompTIA Cloud+ objectives.

### NEW QUESTION # 175

A cloud engineer is migrating a company-hosted application to a cloud provider. The data needs to be secure while stored on the third-party system. Which of the following would best ensure that the data is secure? (Choose two.)

- A. TLS
- B. SSL
- C. Hashing
- D. SAML
- E. AES
- F. Encoding

**Answer: A,E**

Explanation:

To ensure data security while stored on a third-party cloud provider, encryption is the most effective method. AES (Advanced Encryption Standard) is used for encrypting data at rest, ensuring that stored information remains secure from unauthorized access. TLS (Transport Layer Security) protects data in transit, encrypting communication between the application and cloud storage to prevent interception or tampering.

These two methods provide comprehensive protection for both stored and transmitted data, maintaining confidentiality and integrity.

### NEW QUESTION # 176

Which of the following requirements are core considerations when migrating a small business's on-premises applications to the cloud? (Select two).

- A. Testing
- B. Hybrid
- C. Availability
- D. Compute
- E. Logs
- F. Networking

**Answer: C,F**

Explanation:

When migrating on-premises applications to the cloud for a small business, availability and networking are core considerations. Ensuring that applications are available and that the network is capable of handling the new cloud traffic are pivotal for a successful

transition.

The migration process and its core considerations, including availability and networking, are topics within the Business Principles of Cloud Environments in the CompTIA Cloud+ material.

#### NEW QUESTION # 177

A cloud engineer is concerned about command-and-control (C2) communication leaving a cloud network over HTTPS. Which of the following should the cloud engineer implement to most efficiently identify this type of communication?

- A. Inline IPS
- B. Hourly cron jobs listing connections
- C. Traffic mirroring
- D. Cloud flow logs

**Answer: D**

Explanation:

Cloud flow logs are the most efficient way to identify suspected C2 activity over HTTPS because they provide network metadata (source/destination IPs, ports, protocol, bytes/packets, accept/deny decisions) at scale with low operational overhead. In the Cloud+ CV0-004 objectives, this aligns with implementing logging/monitoring to support threat detection, incident response, and continuous security validation. While HTTPS encrypts payload contents, flow logs still reveal high-value indicators such as repeated outbound connections to rare destinations, unusual session frequency, unexpected egress from sensitive subnets, and abnormal data transfer patterns—common traits of C2 beaconing.

An inline IPS can detect and block certain threats, but it adds latency, cost, and complexity, and it may be limited by encryption unless TLS inspection is used. Hourly cron jobs are ad hoc, incomplete, and not scalable compared with centralized telemetry. Traffic mirroring enables deep packet inspection, but it generates large volumes of data and is typically used selectively due to cost and performance impact.

Therefore, flow logs provide the best efficiency-to-visibility balance for identifying HTTPS-based C2 patterns.

#### NEW QUESTION # 178

A systems administrator needs to configure backups for the company's on-premises VM cluster. The storage used for backups will be constrained on free space until the company can implement cloud backups. Which of the following backup types will save the most space, assuming the frequency of backups is kept the same?

- A. Incremental
- B. Full
- C. Differential
- D. Snapshot

**Answer: A**

Explanation:

An incremental backup strategy saves space because it only backs up data that has changed since the last backup. Compared to full and differential backups, incremental backups are smaller and save more space, which is essential when storage is constrained.
