

# Snowflake NAS-C01 Exam | NAS-C01 Latest Test Cram - Trustable Platform Supplying Reliable NAS-C01 Real Exam Questions

Our experts generalize the knowledge of the exam into our NAS-C01 exam materials showing in three versions. PDF version of NAS-C01 study questions - support customers' printing request, and allow you to have a print and practice in papers. Software version of NAS-C01 learning guide - supporting simulation test system. App/online version of mock quiz - Being suitable to all kinds of equipment or digital devices, and you can review history and performance better. And you can choose the favorite one.

If you are going to purchasing the NAS-C01 exam bootcamp online, you may pay more attention to the pass rate. With the pass rate more than 98%, our NAS-C01 exam materials have gained popularity in the international market. And we have received many good feedbacks from our customers. In addition, we offer you free demo to have a try before buying NAS-C01 Exam Braindumps, so that you can have a deeper understanding of what you are going to buy. You can also enjoy free update for one year, and the update version for NAS-C01 will be sent to your email automatically.

## NAS-C01 Pass-Sure Torrent - NAS-C01 Actual Braindumps & NAS-C01 Test Cram

Every user has rated study material positively and passed the NAS-C01 Exam. Prep4pass gives a guarantee to the customers that if they fail to pass the SnowPro Specialty - Native Apps (NAS-C01) certification on the very first try despite all their efforts they can claim their money back according to terms and conditions. A team of experts is working day and night in order to make the product successful day by day and provide the customers with the best experience.

## Snowflake SnowPro Specialty - Native Apps Sample Questions (Q362-Q367):

### NEW QUESTION # 362

A provider is testing their Snowflake Native Application in a consumer environment. The application includes a Streamlit app that displays data from a table provisioned in the consumer account. The consumer reports that the Streamlit app is displaying an error related to accessing the table. The 'streamlit.secretS' dictionary is used to store the database connection details. The application role 'app\_role' is designed to have access to the table. Which of the following could be potential causes of the problem, assuming the connection details are valid?

- A. The Streamlit app is not properly configured to assume the when executing queries.
- B. The 'streamlit.secretS' dictionary is not accessible to the application due to incorrect file permissions.
- C. The consumer has not shared the database containing the table with the provider account.
- D. The 'app\_role' does not have the privilege on the database containing the table.
- E. The 'app\_role' does not have the 'SELECT' privilege on the table.

Answer: A,D,E

Explanation:

Options A, B, and C are correct. For the Streamlit app to function correctly, the 'app\_role' must have 'USAGE' on the database, 'SELECT' on the table, and the Streamlit app must be correctly configured to assume the 'app\_role' when executing queries. Option D is incorrect because the table is provisioned in the consumer environment, so sharing with the provider is not applicable. Option E is incorrect because streamlit.secrets' is a dictionary within the app, not related to file permissions.

### NEW QUESTION # 363

A customer is attempting to install your Snowflake Native Application from the Snowflake Marketplace, but the installation fails. You need to troubleshoot the issue. Which of the following steps would provide the most direct and relevant information for diagnosing the cause of the installation failure?

- A. Examine the application's code repository for any recent changes that might have introduced errors.
- B. Ask the customer to share their Snowflake account identifier to check internal logs.
- C. Review the Snowflake Marketplace listing details to ensure all required components and dependencies are accurately specified.
- **D. Query the view in the consumers account to retrieve detailed information about the installation attempt, including error messages and status codes.**
- E. Check the Snowflake system status page for any reported outages or incidents that might be affecting the Marketplace.

**Answer: D**

Explanation:

Option C directly addresses the problem. The 'SNOWFLAKE.MARKETPLACE.APPLICATION INSTALLATION HISTORY' view provides granular details about installation attempts, including specific error messages that can pinpoint the root cause. Option A checks application's code. Option B checks the marketplace listing. Option D can only confirm service issues, but not resolve customer issue. Option E asks the customers snowflake account identifier, this is not recommended approach.

### NEW QUESTION # 364

You are developing a Snowflake Native Application that needs to be deployed across multiple Snowflake accounts. The application includes a setup script that creates several tables and stored procedures. However, some consumers might have naming conflicts with the objects created by your setup script. Which of the following strategies can you use to minimize naming conflicts and ensure smooth application deployment? (Select all that apply)

- A. Instruct consumers to drop any conflicting objects before installing the application.
- **B. Dynamically generate object names within the setup script using the application's name and a random suffix.**
- C. Utilize the 'CREATE OR REPLACE' syntax for all objects in the setup script to overwrite any existing objects.
- **D. Package all application objects into a dedicated schema within the consumer's database.**
- **E. Prefix all objects created by the setup script with a unique, application-specific identifier.**

**Answer: B,D,E**

Explanation:

Prefixing objects with an application-specific identifier provides a clear and consistent way to avoid naming collisions. Dynamically generating object names makes it very unlikely for conflicts to occur. Packaging objects into a dedicated schema isolates the application's objects and prevents them from interfering with the consumer's existing objects. Asking consumers to drop objects is not user-friendly and can lead to data loss. Using 'CREATE OR REPLACE' might unintentionally overwrite important objects belonging to the consumer.

### NEW QUESTION # 365

You are developing a Snowflake Native App that processes sensitive customer data. Your app needs to access data from a table owned by the consumer and write transformed data back to another table also owned by the consumer. To ensure data privacy and security, you decide to use a secure view for accessing the customer data and a stored procedure for writing the transformed data. However, you are facing issues with privilege escalation when the stored procedure tries to access the secure view. The stored procedure is defined with the 'EXECUTE AS CALLER' clause. Which of the following steps can you take to mitigate this privilege escalation issue and ensure secure data access?

- A. Revoke the 'SELECT' privilege on the secure view from the application role. Grant the 'SELECT' privilege on the secure view directly to the stored procedure using the 'GRANT ... TO PROCEDURE' syntax.

- B. Change the stored procedure to run with the 'EXECUTE AS OWNER clause. Ensure the consumer grants 'IMPORTED PRIVILEGES' on their database to your application. Create a database role owned by the application and grant USAGE on database to it and SELECT on secure view to the database role. Also, grant the consumer database ownership to the application.
- C. Grant the 'EXECUTE MANAGED TASK' privilege to the application role. Change the stored procedure to run with the 'EXECUTE AS OWNER clause. Ensure consumer grants 'IMPORTED PRIVILEGES' on their database to your application.
- D. Grant the 'APPLY MASKING POLICY privilege on the customer data table to the application role. Define masking policies on the sensitive columns of the customer data table.
- E. Change the stored procedure to run with the 'EXECUTE AS OWNER clause. Ensure the consumer grants 'IMPORTED PRIVILEGES' on their database to your application. Create a database role owned by the application and grant USAGE on database to it and SELECT on secure view to the database role.

**Answer: E**

Explanation:

When using ' EXECUTE AS CALLER , the stored procedure executes with the privileges of the user calling it, which can lead to privilege escalation. To avoid this, switch to 'EXECUTE AS OWNER , which runs the procedure with the privileges of the procedure's owner (the application). Consumers granting 'IMPORTED PRIVILEGES' allows the application to access database objects. A database role owned by the application ensures consistent privileges, and granting USAGE on the database and SELECT on the secure view to this role provides the necessary access. The app should not get OWNERSHIP of the CONSUMER Database.

#### NEW QUESTION # 366

You are building a Snowflake Native Application that needs to store configuration data within the application package. This configuration data needs to be accessible by all components of the application, but should not be directly exposed to the consumer. What is the RECOMMENDED approach to securely store and access this configuration data?

- A. Store the configuration in a file within the application package and load it into a temporary table during application initialization. Only grant access to the application role.
- B. Store the configuration data as environment variables within the application's setup script.
- C. Encrypt the configuration data and store it in a named internal stage within the application package. Create a UDF within the application to decrypt and retrieve the data when needed.
- D. Store the configuration data in a JSON file within a stage in the provider account and grant the application role USAGE privilege to the stage.
- E. Store the configuration data in a dedicated table within the application database and grant SELECT privilege only to the application role.

**Answer: C**

Explanation:

Encrypting the configuration data and storing it in a named internal stage (Option D) provides the highest level of security. The encryption ensures that the data is protected even if the application package is compromised. The UDF allows controlled access to the decrypted data within the application, preventing direct exposure to the consumer. Option A exposes data outside of the application, option B provides more access than needed. Options C and E are not appropriate. Option C is volatile, option E stores data outside of the install package.

#### NEW QUESTION # 367

.....

The NAS-C01 certification is the way to go in the modern Snowflake era. Success in the SnowPro Specialty - Native Apps exam of this certification plays an essential role in an individual's future growth. Nowadays, almost every tech aspirant is taking the test to get NAS-C01 certification and find well-paying jobs or promotions. But the main issue that most of the candidates face is not finding updated Snowflake NAS-C01 Practice Questions to prepare successfully for the Snowflake NAS-C01 certification exam in a short time.

**NAS-C01 Real Exam Questions:** [https://www.prep4pass.com/NAS-C01\\_exam-braindumps.html](https://www.prep4pass.com/NAS-C01_exam-braindumps.html)

Get a success with an absolute guarantee to pass Snowflake SnowPro Core Certification NAS-C01 (Installing and Configuring

SnowPro Core Certification) test on your first attempt, Each version has the same questions and answers, and you can choose one from them or three packaged downloads of NAS-C01 training materials, Snowflake NAS-C01 Latest Test Cram Many preferential benefits provided for you, Our NAS-C01 pdf torrent are written and tested by our certified IT experts to the highest standards of technical accuracy.

You are strongly encouraged to take advantage of these NAS-C01 new wizards to expedite your setup time and allow you to focus on defining the scope of work for the project.
