Peoplecert ITIL-4-Practitioner-Deployment-Management題庫更新資訊 & ITIL-4-Practitioner-Deployment-Management考試大綱

我們Testpdf Peoplecert的ITIL-4-Practitioner-Deployment-Management考試學習指南可以成為你職業生涯中的燈塔，因為它包含了一切需要通過的ITIL-4-Practitioner-Deployment-Management考試，選擇我們Testpdf，可以幫助你通過考試，這是個絕對明智的決定，因為它可以讓你從那些可怕的研究中走出來，Testpdf就是你的幫手，你可以得到雙倍的結果，只需要付出一半的努力。

Peoplecert ITIL-4-Practitioner-Deployment-Management 考試大綱：

主題	簡介
主題 1	<ul style="list-style-type: none">The ITIL Capability model: This section of the exam measures the skills of a Service Transition Manager and introduces how capability criteria contribute to developing and maturing Deployment Management practices. It focuses on aligning organizational capabilities with ITIL best practices to maintain consistency, quality, and effectiveness in service transitions.

主題 2	<ul style="list-style-type: none"> Practice success factors: This section of the exam measures the skills of a Change Implementation Lead and focuses on understanding practice success factors and the core metrics used to evaluate deployment effectiveness. It emphasizes the importance of tracking efficiency and success in service deployment and how these metrics help improve the overall stability and agility of the service transition process.
主題 3	<ul style="list-style-type: none"> Roles and competencies: This section of the exam measures the skills of a Change Implementation Lead and focuses on identifying essential roles within Deployment Management and the competencies needed to perform them effectively. It explores how to position deployment responsibilities within an organization and what skill sets are necessary to ensure deployment tasks are carried out successfully.
主題 4	<ul style="list-style-type: none"> Partners and suppliers: This section of the exam measures the skills of a Change Implementation Lead and examines the influence of partners and suppliers in the deployment process. It highlights the importance of effective collaboration and communication with external stakeholders to ensure that deployments are delivered according to expectations and with minimal risks.
主題 5	<ul style="list-style-type: none"> Information and technology: This section of the exam measures the skills of a Service Transition Manager and explores how technology and information systems support deployment activities. It covers how tools and digital platforms can enhance the planning, tracking, and execution of deployment efforts, ultimately contributing to more reliable and streamlined service rollouts.

最新的 ITIL Practitioner Level ITIL-4-Practitioner-Deployment-Management 免費考試真題 (Q18-Q23):

問題 #18

[Apply Deployment Management Processes]

An organization is deploying new software and new servers to support a service that will be launched soon. Which TWO of these activities should the organization conduct as part of the 'verification of the service components' activity of the 'deployment lifecycle management' process?

Checking that the correct models of server have been supplied

Testing the software for defects

Creating a schedule for installing the new servers

Installing the new software to the newly installed servers

- A. 2 and 3
- B. 3 and 4
- C. 1 and 4
- D. 1 and 2

答案: D

解題說明:

In ITIL 4, the 'verification of service components' activity within the deployment lifecycle management process ensures that delivered components meet specifications before deployment. The correct activities are:

Activity 1 (Checking that the correct models of server have been supplied): Part of verification, as it confirms that the hardware components match requirements.

Activity 2 (Testing the software for defects): Part of verification, as it ensures the software is functional and free of critical issues before deployment.

Activity 3 (Creating a schedule for installing the new servers): Incorrect, as scheduling is a planning activity, not verification.

Activity 4 (Installing the new software to the newly installed servers): Incorrect, as installation is part of the deployment execution, not verification.

問題 #19

[Measure and Improve Deployment Management]

An organization is aiming to achieve capability level 3 for the deployment management practice. What is an indication of the achievement of capability level 3?

- A. The deployment manager is able to report on the effectiveness of the deployment management practice
- B. Deployment models are developed and implemented
- C. The deployment management team regularly suggests and implements improvement opportunities
- D. Employees from other practices understand how deployment activities are integrated into relevant workflows

答案： D

解題說明：

ITIL 4 defines capability level 3 for a practice as achieving integration across the organization, where the practice is embedded into broader workflows and understood by related practices. For deployment management, an indication of reaching capability level 3 is when employees from other practices understand how deployment activities are integrated into relevant workflows (Option B). This demonstrates cross-functional alignment and maturity, showing that deployment management is not siloed but part of the organization's value streams.

Option A (The deployment management team regularly suggests and implements improvement opportunities): Incorrect, as continual improvement is characteristic of higher capability levels (e.g., level 4), not the defining feature of level 3.

Option B (Employees from other practices understand how deployment activities are integrated into relevant workflows): Correct, as level 3 focuses on integration and collaboration across practices, per ITIL 4's capability framework.

Option C (The deployment manager is able to report on the effectiveness of the deployment management practice): Incorrect, as reporting effectiveness is a general management task, not specific to level 3 maturity.

Option D (Deployment models are developed and implemented): Incorrect, as model development occurs at lower capability levels (e.g., level 1 or 2), not a hallmark of level 3.

問題 #20

[Understand Roles and Responsibilities]

A fast-growing service provider is introducing separate roles of deployment manager and deployment practitioner. Which TWO activities is a deployment manager responsible for?

Ensuring that deployment records are up-to-date and correct

Prioritizing multiple deployments that require use of the same resources
Ensuring deployment plans support other service management plans
Capturing and verifying users' opinions on deployments

- A. 2 and 3
- B. 1 and 2
- C. 3 and 4
- D. 1 and 4

答案： A

解題說明：

In ITIL 4, the deployment manager role focuses on strategic and coordinating activities, such as overseeing resource allocation and aligning deployment plans with broader service management objectives. The correct activities are:

Activity 2 (Prioritizing multiple deployments that require use of the same resources): A deployment manager ensures efficient resource use by prioritizing conflicting deployments, a key managerial responsibility.

Activity 3 (Ensuring deployment plans support other service management plans): The deployment manager aligns deployment activities with other practices (e.g., change enablement, release management) to ensure coherence across service management, another strategic task.

Activity 1 (Ensuring that deployment records are up-to-date and correct): This is typically a task for a deployment practitioner, who handles operational details like record-keeping, not a manager's core responsibility.

Activity 4 (Capturing and verifying users' opinions on deployments): This aligns more with practices like relationship management or service desk activities, not the deployment manager's role, which focuses on planning and execution rather than user feedback collection.

問題 #21

[Measure and Improve Deployment Management]

An organization has an objective to create and use deployment approaches that would fit the needs of the organization and the context. How should the organization assess if this objective is achieved?

- A. By asking stakeholders about their satisfaction with deployment lead times
- B. By analyzing the adherence to deployment schedules
- C. By measuring percentage of deployments which did not follow the agreed policies and models

- D. By looking at the deployment backlog throughput

答案： A

解題說明：

ITIL 4 emphasizes stakeholder satisfaction as a key indicator of whether a practice meets organizational needs and context, as it reflects the value delivered to users and the business. Option B, asking stakeholders about their satisfaction with deployment lead times, directly assesses whether deployment approaches are effective and aligned with expectations, making it the best method to evaluate the objective.

Option A (By looking at the deployment backlog throughput): Incorrect, as throughput measures efficiency but does not directly indicate whether the deployment approach fits the organization's needs or context.

Option B (By asking stakeholders about their satisfaction with deployment lead times): Correct, as stakeholder feedback on lead times reflects whether deployments are timely and valuable, aligning with ITIL 4's focus on value co-creation.

Option C (By measuring the percentage of deployments which did not follow the agreed policies and models): Incorrect, as non-compliance indicates process issues but does not directly assess fit with organizational needs or stakeholder satisfaction.

Option D (By analyzing the adherence to deployment schedules): Incorrect, as schedule adherence measures operational performance, not whether the approach meets broader contextual needs.

問題 #22

[Use Tools and Techniques for Deployment]

An organization manually notifies its development and operations teams about potentially faulty deployments. Which tools should be used to automate this process?

- A. Service configuration management tools
- B. Work planning and prioritization tools
- C. Environment configuration and management tools
- **D. Workflow management and collaboration tools**

答案： D

解題說明：

Automating notifications about faulty deployments requires tools that facilitate communication and process orchestration between teams. ITIL 4 recommends workflow management and collaboration tools (Option B), such as Slack, Microsoft Teams, or ServiceNow, to automate alerts, streamline communication, and ensure timely responses to deployment issues.

Option A (Service configuration management tools): Incorrect, as these tools manage configuration item data in a CMDB, not notifications or team communication.

Option B (Workflow management and collaboration tools): Correct, as these tools automate notifications and enable seamless collaboration between development and operations teams, addressing the issue directly.

Option C (Work planning and prioritization tools): Incorrect, as tools like Jira focus on task management, not real-time notification automation.

Option D (Environment configuration and management tools): Incorrect, as these tools (e.g., Puppet) manage environment setups, not team notifications.
