最新的 CEH v13 312-50v13 免費考試真題 (Q527-Q532):

問題 #527
Maria is conducting passive reconnaissance on a competitor without interacting with their systems. Which method would be least appropriate and potentially risky?

- A. Examining patent databases and public records
- B. Reviewing forums and social media
- C. Running an intensive port scan on public IPs
- D. Using the Wayback Machine

答案：C

解題說明：
CEH v13 defines passive reconnaissance as information gathering without directly interacting with the target's systems. Activities such as reviewing archived websites, social media, forums, and public records are all passive and legal.
Running an intensive port scan, however, is an active reconnaissance technique. According to CEH v13, port scanning directly interacts with target systems and can trigger IDS/IPS alerts, logs, and even legal consequences if done without authorization.
Therefore, option B violates the principles of passive reconnaissance and is the riskiest choice.

問題 #528
James is working as an ethical hacker at Technix Solutions. The management ordered James to discover how vulnerable its network is towards footprinting attacks. James took the help of an open-source framework for performing automated reconnaissance activities. This framework helped James in gathering information using free tools and resources. What is the framework used by James to conduct footprinting and reconnaissance activities?

- A. SpeedPhish Framework
- B. WebSploit Framework
- C. Browser Exploitation Framework
- D. OSINT framework

答案：D

問題 #529
Bob, your senior colleague, has sent you a mail regarding a deal with one of the clients. You are requested to accept the offer and you oblige. After 2 days, Bab denies that he had ever sent a mail. What do you want to
'"know'" to prove yourself that it was Bob who had send a mail?

- A. Authentication
- B. Non-Repudiation
- C. Integrity
- D. Confidentiality

答案：B

解題說明：
Non-repudiation is the assurance that someone cannot deny the validity of something. Non-repudiation is a legal concept that is widely used in information security and refers to a service, which provides proof of the origin of data and the integrity of the data. In other words, non-repudiation makes it very difficult to successfully deny who/where a message came from as well as the authenticity and integrity of that message.

問題 #530
Which of the following is a low-tech way of gaining unauthorized access to systems?

- A. Eavesdropping

- B. Social Engineering
- C. Sniffing
- D. Scanning

答案：B

解題說明：
Social engineering is a non-technical attack that manipulates human behavior to gain access to systems or data. It often involves deception (e.g., phishing, pretexting, baiting) and requires no technical expertise or tools, making it a low-tech yet highly effective method.
Reference - CEH v13 Official Study Guide:
Module 9: Social Engineering
Quote:
"Social engineering exploits human psychology and trust to gain unauthorized access. It is considered a low- tech method because it does not require technical means." Incorrect Options Explained:
B: Eavesdropping may require technical tools to intercept data.
C: Scanning involves active use of tools to find vulnerabilities.
D: Sniffing is technical and requires tools to capture network traffic.

問題 #531
A penetration tester is assessing a web application that uses dynamic SQL queries for searching users in the database. The tester suspects the search input field is vulnerable to SQL injection. What is the best approach to confirm this vulnerability?

- A. Use a directory traversal attack to access server configuration files
- B. Inject JavaScript into the search field to test for Cross-Site Scripting (XSS)
- C. Input DROP TABLE users; -- into the search field to test if the database query can be altered
- D. Perform a brute-force attack on the user login page to guess weak passwords

答案：C

解題說明：
CEH explains that SQL injection testing should begin with controlled, intentional manipulation of SQL syntax to determine whether user input is improperly concatenated into backend queries. While destructive queries like DROP TABLE are not recommended in real-world ethical hacking engagements, CEH uses this example as a conceptual demonstration of how SQLi can influence database commands. In practice, a penetration tester would more safely use benign tautologies such as ' OR '1'='1 to test whether unauthorized data is returned. However, within CEH's theoretical framing, injecting a clearly malicious SQL command demonstrates whether the input is executed at the database level. This validates improper sanitization, the use of dynamic SQL queries, and missing parameterized input handling. CEH stresses that SQLi is among the most critical vulnerabilities because it allows attackers to bypass authentication, exfiltrate data, or manipulate the database structure. XSS, brute-forcing, and directory traversal do not test SQL query manipulation and therefore do not confirm SQL injection.
