A systems administrator plans to use Non-Disruptive Migration (NDM) to migrate data from a VMAX array running Enginuity 5876 to a PowerMax running PowerMaxOS 5978. Which NDM mode is used?

- **A. Adaptive Copy**
- B. Asynchronous
- C. Pass-through
- D. Metro-based

Answer: A

Explanation:

Step by Step Comprehensive Detailed Explanation:

Non-Disruptive Migration (NDM) in PowerMax offers different modes for migrating data between storage arrays. When migrating from a VMAX array running Enginuity 5876 to a PowerMax running PowerMaxOS 5978, the Adaptive Copy mode is used.

Adaptive Copy mode is designed for migrations between different storage array platforms or microcode versions. It provides flexibility and efficiency by dynamically adjusting the migration process based on the source and target array capabilities.

Why other options are incorrect:

* A. Asynchronous: This mode is typically used for SRDF replication, not NDM.

* C. Pass-through: This mode is not relevant to NDM.

* D. Metro-based: This mode is used for specific metro distance configurations in SRDF.
