Fortinet NSE 7 - Public Cloud Security 7.6 Architect Sample Questions (Q30-Q35):

NEW QUESTION # 30

Refer to the exhibit. After analyzing the native monitoring tools available in Azure, an administrator decides to use the tool displayed in the exhibit.

Why would an administrator choose this tool?

Azure monitoring

- A. To obtain, and later examine, traffic flow data with a visualization tool.
- B. To view details about Azure resources and their relationships across multiple regions.
- C. To compare the latency of an on-premises site with the latency of an Azure application.
- D. To help debug issues affecting virtual network gateways.

Answer: C

Explanation:

The exhibit shows Azure Network Watcher - Connection Monitor, which is used to track and measure connectivity and latency between on-premises environments, Azure applications, and across Azure regions. An administrator would choose this tool to compare the latency of an on-premises site with the latency of an Azure-hosted application and troubleshoot connectivity issues.

NEW QUESTION # 31

Refer to the exhibit. An AWS administrator created a change set to examine the effects of proposed changes to the current infrastructure.

Based on only the output shown in the exhibit, what will happen if the administrator applies these changes?

Change set configuration

```
"Changes": [
  {
    "Type": "Resource",
    "ResourceChange": {
      "ResourceType": "AWS::EC2::Instance",
      "LogicalResourceId": "FortiGate_A",
      "PhysicalResourceId": "i0cb1020adr1b308b",
      "Action": "Modify",
      "Replacement": "True",
```

- A. The PhysicalResourceId will remain the same.
- B. The resulting FortiGate instance will lose its current local users.
- C. CloudFormation will roll back the current stack before updating it.
- D. The deployment will take place without any service interruption.

Answer: B

Explanation:

The change set output shows "Action": "Modify" and "Replacement": "True", meaning the FortiGate EC2 instance will be replaced with a new one. When an EC2 instance is replaced, its existing local configurations (such as local users) are lost, unless externalized to persistent storage or automation.

NEW QUESTION # 32

What is the main advantage of using SD-WAN Transit Gateway Connect over traditional SD- WAN?

- **A. You can use GRE-based tunnel attachments.**
- B. You can combine it with IPsec to achieve higher bandwidth.
- C. You can use BGP over IPsec for maximum throughput.
- D. It eliminates the use of ECMP.

Answer: A

Explanation:

The main advantage of SD-WAN Transit Gateway Connect is that it supports GRE-based tunnel attachments to AWS Transit Gateway. This provides higher throughput and lower overhead compared to traditional VPN (IPsec) connections, making it more efficient for SD-WAN integration.

NEW QUESTION # 33

Refer to the exhibit.

You are troubleshooting a Microsoft Azure SDN connector issue on your FortiGate VM in Azure. Which command can you use to examine details about API calls sent by the connector?

- **A. diag debug application azd -1**
- B. diag debug application cloud-connector -1
- C. diag test application azd 1
- D. get system sdn-connector

Answer: A

NEW QUESTION # 34

Refer to the exhibit.

A senior administrator in a multinational organization needs to include a comment in the template shown in the exhibit to ensure that administrators from other regions change the Amazon Machine Image (AMI) ID to one that is valid in their location. How can the administrator add the required comment in that section of the file?

- A. The administrator must update the AWSTemplateFormatVersion to the latest version.
- B. The administrator can include the comment with the aws cloudformation update-stack command.
- C. The administrator can add the comment starting with the # character next to the "Resources" section.
- **D. The administrator must convert the template file to YAML format to add a comment.**

Answer: D

Explanation:

According to the FortiOS 7.6 AWS Administration Guide and the Fortinet 7.4 Public Cloud Security study materials regarding infrastructure as code (IaC) for cloud deployments:

* **JSON Format Limitations (Option B):** The exhibit shows an AWS CloudFormation template in JSON (JavaScript Object Notation) format. JSON, by its official specification, does not support comments.

There is no native syntax (like // or /* */) to include remarks that are ignored by the CloudFormation parser.

* **YAML Support:** To add descriptive comments—such as instructing other regional administrators to update the AMI ID—the administrator must convert the template into YAML format. YAML is a superset of JSON and specifically supports comments using the # character.

* **Best Practice for Multinational Deployments:** For organizations operating across multiple AWS regions, using YAML is the recommended standard because it allows for inline documentation, making templates more maintainable and easier for different teams to understand regional requirements.

Why other options are incorrect:

* **Option A:** Comments are part of the template file itself, not a parameter or flag within the aws cloudformation update-stack CLI command.

* **Option C:** While # is the correct character for comments in YAML, it is invalid syntax in JSON and would cause the CloudFormation stack creation to fail with a parsing error.

* **Option D:** The AWSTemplateFormatVersion "2010-09-09" is currently the only valid version for CloudFormation templates; updating it does not add JSON comment support.
