CTFL-AT Reliable Test Price, CTFL-AT Questions Pdf

Free renewal of our CTFL-AT study prep in this respect is undoubtedly a large shining point. Apart from the advantage of free renewal in one year, our CTFL-AT exam engine offers you constant discounts so that you can save a large amount of money concerning buying our CTFL-AT Training Materials. And we give these discount from time to time, so you should come and buy CTFL-AT learning guide more and you will get more rewards accordingly.

ISQI ISTQB Certified Tester - Foundation Level Extension - Agile Tester Sample Questions (Q53-Q58):

NEW QUESTION # 53

In Agile projects, which of the following approaches would result in the best compromise for preserving independence of testers and for allowing testers to have a good understanding of the product as well as good relationships with other team members?

- A. Having independent separate test teams where all of the testers work separately from developers without being assigned to Agile teams
- **B. Having independent separate test teams where testers are assigned to Agile teams on a long-term basis, at the beginning of an Agile project**
- C. Having only Agile teams where testers are integral parts and where they perform many of the testing tasks, without having an independent test team
- D. Having independent separate test teams where testers are assigned to Agile teams on-demand during the final days of each iteration

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

From CTFL-AT Syllabus v4.0, Section 2.5 Testers and Independence, it states:

"Testers may be assigned to Agile teams on a permanent or rotating basis. While full independence is compromised, this setup allows for better collaboration and understanding of the product, while still maintaining some degree of independence." Thus, Option B is the most accurate - long-term embedded testers support Agile collaboration while preserving partial independence.

* Option A leads to late involvement, which contradicts Agile principles.

* Option C sacrifices independence entirely.

* Option D is traditional and contrary to Agile values of collaboration.

Learning Objective (K2) - Understand approaches to preserving test independence in Agile

NEW QUESTION # 54

What is the definition of agile software development?

- A. Testing carried out informally where no formal test preparation or execution takes place, no recognized test design technique is used and there are no expectations for results.
- B. A way of developing software where the test cases are developed, and often automated, before the software under test is developed.
- **C. A group of software development methodologies based on iterative incremental development with self-organizing cross-functional teams who cooperate to define requirements and to implement the solution.**
- D. A framework to describe the software development lifecycle activities from requirements specification to maintenance where test planning of the various test levels is done as soon as the test basis is ready

Answer: C

NEW QUESTION # 55

An Agile team is developing a Pay-TV web portal. In Iteration 3, only PayPal and credit card payments are supported. A new user story in Iteration 4 adds payment using credit from a smartcard.

Which of the following would you expect to describe valid and relevant acceptance tests for this user story?

- **A. Tests to check that payments with no credit charged on the smartcard will be unsuccessful**
- B. Tests to check that payments with sufficient credit charged on the smartcard are given five percent discount are successful
- C. Tests to check that payments with insufficient credit charged on the smartcard are successful

- D. Tests to check that payments with expired credit cards of supported credit card types are unsuccessful

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

From CTFL-AT Syllabus v4.0, Section 2.1 Acceptance Criteria and Testability, acceptance tests must be directly related to the new functionality described in the user story.

- * Option Dis correct - it validates the new feature of paying via smartcard credit, specifically handling edge cases (e.g., zero credit).
- * Option A is incorrect - payment should fail with insufficient credit.
- * Option B introduces requirements not mentioned in the story.
- * Option C tests credit card logic, not the new smartcard functionality.

Learning Objective (K3) - Derive acceptance tests from user stories

NEW QUESTION # 56

Which of the following sentences related to Risk-based testing is CORRECT?

- A. Risk-based testing fits well in Agile development processes, as risks are analyzed twice - during release and iteration planning.
- B. Risk-based testing does not fit well in Agile development processes, as short iterations mandate short test times.
- **C. Risk-based testing fits well in Agile development processes, as risks are easy to identify when the work is divided into user stories.**
- D. Risk-based testing does not fit in Agile development processes, as each iteration focuses on limited parts of the product.

Answer: C

Explanation:

Risk-based testing fits well in Agile development processes, as risks are easy to identify when the work is divided into user stories.

User stories are short descriptions of features or functionalities that are valuable to the customers or users. They help to define the scope and priority of the work in each iteration. By breaking down the work into user stories, the Agile team can identify the potential risks associated with each story, such as technical complexity, business criticality, or user feedback. The team can then prioritize the testing effort based on the risk level of each story, ensuring that the most important and risky features are tested first and thoroughly. Risk-based testing also helps to optimize the testing time and resources, as the team can focus on testing the most relevant aspects of the software, rather than testing everything equally. NEW QUESTION # 57

Which statement about an Agile task board is CORRECT?

- A. It is updated once at the end of each iteration.
- **B. It provides detailed visual representation of the whole team's status.**
- C. Only "in progress" tasks are shown on the task board.
- D. It is a detailed visual representation of the status of testing.

Answer: B

Explanation:

An Agile task board is a visual framework to display and sync up on the tasks moving between production steps. It is usually applied to the two most popular Agile development frameworks - Kanban and Scrum. Used by software developers and project managers, an Agile board helps manage workloads in a flexible, transparent, and iterative way¹. An Agile task board provides a detailed visual representation of the whole team's status, showing which tasks remain to be started, which are in progress, and which are done. It also helps to track the progress of the current sprint, identify bottlenecks, and facilitate collaboration and communication among team members². References:
