CCDAK Exam Quizzes & Premium CCDAK Exam

The unmatched and the most workable study guides of ExamDumpsVCE are your real destination to achieve your goal. The pathway to pass CCDAK was not so easy and perfectly reliable as it has become now with the help of our products. Just you need to spend a few hours daily for two weeks and you can surely get the best insight of the syllabus and command over it. The CCDAK Questions and answers in the guide are meant to deliver you simplified and the most up to date information in as few words as possible.

Confluent Certified Developer for Apache Kafka Certification Examination Sample Questions (Q32-Q37):

NEW QUESTION # 32

You are sending messages to a Kafka cluster in JSON format and want to add more information related to each message:

Format of the message payload

Message creation time

A globally unique identifier that allows the message to be traced through the system Where should this additional information be set?

- A. Broker
- **B. Header**
- C. Key
- D. Value

Answer: B

Explanation:

Kafka message headers are the right place to include metadata such as:

Payload format (e.g., schema version)

Timestamps (custom)

Trace or correlation IDs

From Kafka Producer API Docs:

"Headers are a map of key-value pairs that can be used to include metadata alongside the message, without modifying the message body." Keys determine partitioning and ordering Values are the message payload Brokers do not store arbitrary metadata fields
Reference: Kafka ProducerRecord API > Headers

NEW QUESTION # 33

You are creating a Kafka Streams application to process retail data.

Match the input data streams with the appropriate Kafka Streams object.

Table

Stream

Product

Orders_Placed

Customers

Shipment_Of_Orders

ExamDumpsVCE

Answer:

Explanation:

Table

Stream

Orders_Placed

ExamDumpsVCE

Explanation:

- * Table# Product, Customers
- * Stream# Orders_Placed, Shipment_Of_Orders
- * Tables represent slowly changing, reference data- e.g., customer profiles, product info.
- * Streams represent real-time event data- e.g., orders placed, shipments processed.

From Kafka Streams Documentation:

"Use KTable for reference datasets, and KStream for event-based processing such as orders or logs." Reference: Kafka Streams API Concepts

NEW QUESTION # 34

In stream processing applications, handling out-of-order data can be a challenge which could affect the implemented business logic. Which type of Join handles out-of-order records?

- A. KStream- KStream
- B. KTable-KTable
- C. KTable-KStream
- D. KStream-GlobalKTable

Answer: A

NEW QUESTION # 35

Your streams application is reading from an input topic that has 5 partitions. You run 5 instances of your application, each with `num.streams.threads` set to 5. How many stream tasks will be created and how many will be active?

- A. 25 created, 5 active
- B. 25 created, 25 active
- C. 5 created, 1 active
- D. 5 created, 5 active

Answer: A

Explanation:

One partition is assigned a thread, so only 5 will be active, and 25 threads (i.e. tasks) will be created

NEW QUESTION # 36

(You are writing to a Kafka topic with producer configuration `acks=all`.)

The producer receives acknowledgements from the broker but still creates duplicate messages due to network timeouts and retries. You need to ensure that duplicate messages are not created.

Which producer configuration should you set?)

- A. `retries=2147483647max.in.flight.requests.per.connection=5enable.idempotence=false`
- B. `enable.auto.commit=true`
- C. `retries=2147483647max.in.flight.requests.per.connection=1enable.idempotence=true`
- D. `retries=0max.in.flight.requests.per.connection=5enable.idempotence=true`

Answer: C

Explanation:

The official Apache Kafka producer documentation states that setting `enable.idempotence=true` guarantees that messages are written to a partition exactly once, even in the presence of retries caused by network failures or broker timeouts. This feature prevents duplicate records by assigning producer sequence numbers and validating them on the broker side.

For idempotent producers to work correctly, retries must be enabled, which is why Kafka recommends a very large value such as `retries=2147483647`. Additionally, limiting `max.in.flight.requests.per.connection` to 1 ensures strict ordering during retries, preventing message reordering in older Kafka versions and providing the safest configuration.

Option A is irrelevant to producers. Option B explicitly disables idempotence, which causes duplicates.

Option D disables retries, which increases the risk of message loss.

Therefore, the correct and fully documented solution to eliminate duplicate messages is enabling idempotence with retries and a safe in-flight request limit, as shown in Option C.

NEW QUESTION # 37

.....

The CCDAK training prep you see on our website are definitely the highest quality learning products on the market. Of course, the correctness of our CCDAK learning materials is also very important, after all, you are going to take the test after studying. And a lot of our worthy customers praised our accuracy for that sometimes they couldn't find the CCDAK Exam Braindumps on the other websites or they couldn't find the updated questions and answers. Just buy our CCDAK study guide and you won't regret!
