The AWS Certified Developer - Associate exam is an industry-recognized certification that demonstrates a developer's ability to design, develop, and deploy scalable, reliable, and cost-effective applications on the AWS platform. AWS Certified Developer Associate Exam (DVA-C02) certification is ideal for developers who are looking to advance their careers in cloud computing and want to demonstrate their expertise in developing and deploying cloud-based applications. AWS-Developer exam is also suitable for developers who are new to AWS and want to gain a comprehensive understanding of the platform.

The AWS Certified Developer – Associate certification is intended for developers who have at least one year of experience in developing and maintaining AWS-based applications. AWS-Developer Exam covers a range of topics, including AWS core services, database services, deployment, and security. AWS Certified Developer Associate Exam (DVA-C02) certification demonstrates the candidate's ability to design, develop, and deploy cloud-based solutions using AWS.

Without ambiguous points of questions make you confused, our AWS-Developer practice materials can convey the essence of the content suitable for your exam. With our AWS-Developer exam guide, you will achieve what you are expecting with ease.

Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q345-Q350):

NEW QUESTION # 345

A user has enabled serverside encryption with S3. The user downloads the encrypted object from S3. How can the user decrypt it?

- A. S3 does not support server side encryption
- B. The user needs to decrypt the object using their own private key
- C. S3 manages encryption and decryption automatically
- D. S3 provides a server side key to decrypt the object

Answer: C

Explanation:

If the user is using the server-side encryption feature, Amazon S3 encrypts the object data before saving it on disks in its data centres and decrypts it when the user downloads the objects. Thus, the user is free from the tasks of managing encryption, encryption keys, and related tools.

NEW QUESTION # 346

A company wants to implement a continuous integration for its workloads on AWS. The company wants to trigger unit test in its pipeline for commits-on its code repository, and wants to be notified of failure events in the pipeline. How can these requirements be met?

- A. Store the source code on GitHub. Create a CodePipeline to automate unit testing. Use Amazon CloudWatch to trigger notifications of failure events.
- B. Store the source code in AWS CodeCommit. Create a CodePipeline to automate unit testing. Use Amazon SNS to trigger notifications of failure events.
- C. Store the source code in GitHub. Create a CodePipeline to automate unit testing. Use Amazon SES to trigger notifications of failure events.
- D. Store the source code in AWS CodeCommit. Create a CodePipeline to automate unit testing. Use Amazon CloudWatch to trigger notification of failure events.

Answer: D

Explanation:

Cloudwatch will be used to trigger the event. SNS will be used to send the notification.

NEW QUESTION # 347

In a move toward using microservices, a company's Management team has asked all Development teams to build their services so that API requests depend only on that service's data store. One team is building a Payments service which has its own database; the service needs data that originates in the Accounts database. Both are using Amazon DynamoDB.

What approach will result in the simplest, decoupled, and reliable method to get near-real time updates from the Accounts database?

- A. Use Amazon Glue to perform frequent ETL updates from the Accounts database to the Payments database.
- B. Use Amazon Kinesis Data Firehouse to deliver all changes from the Accounts database to the Payments database.
- C. Use Amazon ElastiCache in Payments, with the cache updated by triggers in the Accounts database.
- D. Use Amazon DynamoDB Streams to deliver all changes from the Accounts database to the Payments database.

Answer: D

Explanation:

NEW QUESTION # 348

When developing an AWS Lambda function that processes Amazon Kinesis Data Streams, Administrators within the company must receive a notice that includes the processed data.

How should the Developer write the function to send processed data to the Administrators?

- **A. Use Amazon CloudWatch Events to send the processed data**
- B. Separate the Lambda handler from the core logic
- C. Publish the processed data to an Amazon SNS topic
- D. Push the processed data to Amazon SQS

Answer: A

NEW QUESTION # 349

A Developer is writing a mobile application that allows users to view images from an S3 bucket. The users must be able to log in with their Amazon login, as well as Facebook and/or Google accounts.

How can the Developer provide this authentication functionality?

- **A. Use Amazon Cognito with web identity federation.**
- B. Use AWS IAM Access/Secret keys in the application code to allow Get* on the S3 bucket.
- C. Use AWS STS AssumeRole in the application code and assume a role with Get* permissions on the S3 bucket.
- D. Use Amazon Cognito with SAML-based identity federation.

Answer: A
