Fully Updated Splunk SPLK-2002 Dumps With Latest SPLK-2002 Exam Questions [2026]

By attempting these Splunk Enterprise Certified Architect (SPLK-2002) mock exams, you can enhance your confidence and overcome weaknesses. The SPLK-2002 desktop software of PrepAwayExam works offline on Windows computers. The web-based Splunk SPLK-2002 Practice Exam is compatible with all operating systems and browsers.

Splunk Enterprise Certified Architect Sample Questions (Q129-Q134):

NEW QUESTION # 129

What does setting `site=site0` on all Search Head Cluster members do in a multi-site indexer cluster?

- A. Enables automatic search site affinity discovery.
- B. Sets all members to dynamic captaincy.
- C. Disables search site affinity.
- D. Enables multisite search artifact replication.

Answer: C

Explanation:

Explanation/Reference: <https://docs.splunk.com/Documentation/Splunk/7.3.2/DistSearch/DeploymultisiteSHC>

NEW QUESTION # 130

Which of the following will cause the greatest reduction in disk size requirements for a cluster of N indexers running Splunk Enterprise Security?

- A. Increasing the number of buckets per index.
- B. Setting the cluster search factor to N-1.
- C. Decreasing the data model acceleration range.
- **D. Setting the cluster replication factor to N-1.**

Answer: D

Explanation:

Explanation/Reference: <https://docs.splunk.com/Documentation/Splunk/7.3.2/Indexer/Systemrequirements>

NEW QUESTION # 131

In a four site indexer cluster, which configuration stores two searchable copies at the origin site, one searchable copy at site2, and a total of four searchable copies?

- A. `site_search_factor = origin:2, site1:2, total:4`
- B. `site_search_factor = origin:2, site2:1, total:4`
- C. `site_replication_factor = origin:2, site1:2, total:4`
- **D. `site_replication_factor = origin:2, site2:1, total:4`**

Answer: D

Explanation:

Explanation

Explanation/Reference: <https://docs.splunk.com/Documentation/Splunk/7.3.2/Indexer/Sitereplicationfactor>

NEW QUESTION # 132

Which of the following configuration attributes must be set in server, conf on the cluster manager in a single-site indexer cluster?

- **A. `master_uri`**
- B. `replication_factor`
- C. `site`
- D. `site_replication_factor`

Answer: A

Explanation:

The correct configuration attribute to set in server.conf on the cluster manager in a single-site indexer cluster is `master_uri`. This attribute specifies the URI of the cluster manager, which is required for the peer nodes and search heads to communicate with it¹. The other attributes are not required for a single-site indexer cluster, but they are used for a multisite indexer cluster. The `site` attribute defines the site name for each node in a multisite indexer cluster². The `replication_factor` attribute defines the number of copies of each bucket to maintain across the entire multisite indexer cluster³. The `site_replication_factor` attribute defines the number of copies of each bucket to maintain across each site in a multisite indexer cluster⁴. Therefore, option A is the correct answer, and options B, C, and D are incorrect.

1: Configure the cluster manager 2: Configure the site attribute 3: Configure the replication factor 4: Configure the site replication factor

NEW QUESTION # 133

A search head cluster member contains the following in its server .conf. What is the Splunk server name of this member?

- **A. `node3`**

- B. node1
- C. shc4
- D. idxc2

Answer: A

Explanation:

The Splunk server name of the member can typically be determined by the serverName attribute in the server.conf file, which is not explicitly shown in the provided snippet. However, based on the provided configuration snippet, we can infer that this search head cluster member is configured to communicate with a cluster master (master_uri) located at node1 and a management node (mgmt_uri) located at node3. The serverName is not the same as the master_uri or mgmt_uri; these URIs indicate the location of the master and management nodes that this member interacts with.

Since the serverName is not provided in the snippet, one would typically look for a setting under the [general] stanza in server.conf. However, given the options and the common naming conventions in a Splunk environment, node3 would be a reasonable guess for the server name of this member, since it is indicated as the management URI within the [shclustering] stanza, which suggests it might be the name or address of the server in question.

For accurate identification, you would need to access the full server.conf file or the Splunk Web on the search head cluster member and look under Settings > Server settings > General settings to find the actual serverName. Reference for these details would be found in the Splunk documentation regarding the configuration files, particularly server.conf.

NEW QUESTION # 134
