WGU Introduction to IT Sample Questions (Q41-Q46):

NEW QUESTION # 41

Which type of network is used to connect wireless headphones to a smartphone?

- A. Local area network LAN
- **B. Personal area network PAN**
- C. Extended area network EAN
- D. Wide area network WAN

Answer: B

Explanation:

Wireless headphones typically connect to a smartphone using Bluetooth, which is an example of a personal area network. In Information Technology, a personal area network is a short-range network centered around an individual's devices, usually within a few meters. PAN technology is designed for low power usage and convenient device pairing, making it ideal for accessories such as headphones, smartwatches, fitness trackers, and wireless keyboards. A local area network covers a larger area such as a home, office, or campus and commonly uses Ethernet or Wi-Fi to connect computers and network devices. A wide area network spans large geographic distances and connects networks across cities, countries, or continents, often using leased lines or internet infrastructure. Extended area network is not a standard category used in most networking fundamentals curricula compared with

PAN, LAN, MAN, and WAN. Since the connection between headphones and a phone is short-range and personal, it is best classified as a personal area network. Therefore, the correct answer is PAN.

NEW QUESTION # 42

What is the name of the wireless technology that specifically accommodates distances up to 300 feet?

- A. Near field communication NFC
- **B. Bluetooth**
- C. Wide area network WAN
- D. Wi-Fi

Answer: B

Explanation:

Bluetooth is the wireless technology commonly identified in IT fundamentals as supporting short-range communication up to around 300 feet in higher-power implementations. Bluetooth is designed for personal area networking, connecting devices such as headphones, keyboards, speakers, and smartphones with low power consumption and easy pairing. Different Bluetooth classes exist: some provide only a few meters of range, while higher-power versions can extend to roughly 100 meters, which is close to 300 feet, under good conditions. Wi-Fi typically supports larger local-area coverage and is used to connect devices to local networks and the internet. A wide area network is not a wireless technology standard; it is a type of network spanning large geographic areas. Near field communication is designed for extremely short distances, usually a few centimeters, and is used for contactless payments and quick device taps. Since the question asks for a wireless technology specifically accommodating distances up to 300 feet, Bluetooth best matches that description.

NEW QUESTION # 43

Which type of conversion involves turning off the old system and turning on the new system at a particular date and time?

- A. Phased
- B. Parallel
- C. Pilot
- **D. Direct**

Answer: D

Explanation:

In this approach, users stop using the old system, and the new system is put into use immediately¹. However, direct conversion can be risky, especially without extensive testing beforehand².

NEW QUESTION # 44

A company uses the most up-to-date operating system developed by Microsoft for a desktop computer on its internal network. Which system software does this company's computer use?

- A. iOS
- B. Android
- C. Linux
- **D. Windows**

Answer: D

Explanation:

Microsoft's desktop operating system family is Windows, so a company using Microsoft's most up-to-date desktop operating system is using Windows. In Information Technology, an operating system is system software that manages hardware resources, provides a user interface, and supports applications by handling tasks such as memory management, process scheduling, file systems, device drivers, and network connectivity. Windows is widely used in business environments because of its strong

integration with enterprise tools such as Active Directory, Group Policy, Microsoft 365 services, and broad compatibility with commercial software and peripherals. The other options are operating systems from different ecosystems: Linux is an open-source family of operating systems, Android is primarily designed for mobile devices, and iOS is Apple's mobile operating system for iPhone. Since the question specifically states the operating system is developed by Microsoft and used on a desktop computer, the correct choice is Windows.

NEW QUESTION # 45

What is the name for computer code that humans can understand?

- A. Machine language
- B. High-level programming language
- C. Interpreted language
- D. Compiled language

Answer: B

Explanation:

High-level programming language is the term for computer code that humans can understand. In Information Technology, high-level languages are designed to be readable and closer to natural language and mathematical notation than the binary instructions used by hardware. Examples include Python, Java, C#, and JavaScript. High-level languages use keywords, structured syntax, and abstractions that allow programmers to focus on problem solving rather than on hardware-specific details like memory addresses and CPU registers.

This improves development speed, reduces errors, and makes software easier to maintain. High-level code must be translated into machine language before it can run on a computer. This translation can occur through compilation or interpretation. Compiled language and interpreted language describe how code is executed, not whether it is human-readable. Machine language is the lowest-level code expressed in binary and is not easily understood by humans. Therefore, the correct answer for human-understandable code is high-level programming language.
