SCAIP유효한 인증덤프 - SCAIP최신 시험덤프자료

우리Icertkr는 많은 IT전문가들로 구성되어있습니다. 우리의 문제와 답들은 모두 엘리트한 전문가들이 만들어낸 만큼 시험문제의 적응률은 아주 높습니다. 거의 100%의 정확도를 자랑하고 있습니다. 아마 많은 유사한 사이트들도 많습니다. 이러한 사이트에서 학습가이드와 온라인서비스도 지원되고 있습니다만 우리Icertkr는 이미 이러한 사이트를 뛰어넘은 실력으로 업계에서는 우리만의 이미지를 지키고 있습니다. 우리는 정확한 문제와답만 제공하고 또한 그 어느 사이트보다도 빠른 업데이트로 여러분의 인증시험을 안전하게 패스하도록합니다. Saviynt SCAIP인증시험을 응시하려는 분들은 저희 문제와 답으로 안심하시고 자신 있게 응시하시면 됩니다. 우리Icertkr는 여러분이 100% Saviynt SCAIP인증시험을 패스할 수 있다는 것을 보장합니다.

최신 Advanced IGA Professional SCAIP 무료 샘플문제 (Q25-Q30):

질문 # 25

EIC is configured to create tickets in ServiceNow for requests for disconnected applications. The end user selects 3 different entitlements for a disconnected application and submits the request. How will EIC process this request?

- A. Not a valid scenario because EIC does not support multiple entitlement requests when ServiceNow is integrated as the ticketing system
- B. EIC will create three separate tickets in ServiceNow, one for each of the three entitlements
- C. EIC will combine all three entitlements and create one ticket in ServiceNow
- D. If the "Enable Multi Entitlement Request" option is selected, then three tickets will be created in ServiceNow; otherwise, only one ticket will be created

정답: D

설명:

In Saviynt EIC when integrated with ServiceNow as a ticketing system (ITSM) for disconnected applications, ticket creation behavior depends on the configuration setting "Enable Multi Entitlement Request." If this option is enabled, Saviynt treats each entitlement independently and creates separate tickets in ServiceNow for each entitlement selected in the request. Therefore, if a user selects three entitlements, three individual tickets will be generated, allowing granular tracking and fulfillment of each entitlement.

If the option is not enabled, Saviynt consolidates multiple entitlements into a single request payload, resulting in one ServiceNow ticket that includes all requested entitlements. This approach simplifies ticket management but reduces granularity.

Option B is incorrect because Saviynt fully supports multiple entitlement requests with ServiceNow integration. Option C is only conditionally correct (depends on configuration), making it incomplete. Option D is also conditional and not always true.

Thus, the correct answer is A, as it accurately reflects the behavior based on system configuration.

질문 # 26

Which option can be used in the REST Connector to perform attribute mapping between target application and EIC?

- A. CreateAccountJSON
- B. ImportAccountEntJSON
- C. UpdateAccountJSON
- D. CreateAccountEntJSON

정답: A

설명:

In Saviynt EIC REST connector configurations, attribute mapping between Saviynt and the target application is primarily handled during provisioning operations such as account creation and updates. Among the given options, CreateAccountJSON is the correct configuration where attribute mapping is explicitly defined for provisioning new accounts in the target system.

CreateAccountJSON (Option C) contains the payload structure and field mappings that determine how Saviynt attributes (such as username, email, department, etc.) are translated into the target application's API request format. Administrators define mappings using placeholders and transformation logic to ensure correct data flow from Saviynt to the external system.

Option A (ImportAccountEntJSON) is used for reconciliation (importing accounts and entitlements), not provisioning. Option B (CreateAccountEntJSON) is not a standard REST connector configuration in Saviynt.

Option D (UpdateAccountJSON) is used for modifying existing accounts, but the primary and most commonly referenced mapping configuration for attribute mapping is defined in CreateAccountJSON during initial provisioning.

Thus, CreateAccountJSON is the correct answer for attribute mapping between EIC and the target application.

질문 # 27

Which campaign type should be used when managers must review and certify access for their direct reportees?

- A. Role Owner Campaign
- B. User Manager Campaign
- C. Service Account Campaign
- D. Entitlement Owner Campaign

정답: B

설명:

The correct answer is A. User Manager Campaign . In Saviynt, the User Manager campaign is specifically designed for manager-based certifications, where managers review and certify the access of their direct reportees. Saviynt documentation explicitly states that in a User Manager campaign, managers are responsible for reviewing and certifying the access of users who report to them. That makes this campaign type the best fit when the certification driver is the reporting hierarchy rather than entitlement ownership, role ownership, or service account ownership.

The other options represent different certification ownership models. Entitlement Owner Campaign is meant for entitlement owners, Role Owner Campaign is for role owners, and Service Account Campaign is focused on service account ownership verification and access review. Saviynt also describes campaigns as a way to automatically generate and distribute certifications to the appropriate certifiers based on the selected campaign type and ownership model. Therefore, when the requirement clearly says "managers must review direct reportees," the User Manager campaign is the correct and most aligned selection within Saviynt Level 200 scope.

질문 # 28

What parameters are necessary for configuring acctEntMappings in the REST Connector? (Multi-Select)

- A. listPath
- B. idPath
- C. keyField
- D. accountID

정답: A,B,C

설명:

In Saviynt REST connector configuration, acctEntMappings is used to define how account-entitlement relationships are extracted and mapped from the target system response. This configuration is critical when importing entitlements associated with accounts, such as groups, roles, or permissions.

The required parameters for configuring acctEntMappings include listPath, idPath, and keyField. listPath (Option A) specifies the JSON path where the entitlement list is located within the API response. This allows Saviynt to identify the array or collection containing entitlement data. idPath (Option B) defines the unique identifier for each entitlement within that list, ensuring proper tracking and mapping. keyField (Option C) is used to associate the entitlement back to the account, effectively linking account and entitlement records.

Option D (accountID) is not a valid parameter within acctEntMappings configuration. While account identifiers are important in overall mapping, acctEntMappings specifically uses keyField instead of accountID to establish relationships.

Thus, the correct parameters required for acctEntMappings are listPath, idPath, and keyField, as per Saviynt REST connector configuration standards.

질문 # 29

An EIC Administrator has a requirement to execute provisioning as soon as the user import is completed, what type of job can be configured to achieve this?

- A. Single Threaded Job
- B. WSRetry job
- C. Trigger chain job
- D. Multi threading job

정답: C

설명:

In Saviynt EIC, job orchestration and sequencing are critical for automating identity lifecycle processes such as user import followed by provisioning. To ensure that provisioning starts immediately after user import completes, Saviynt provides the concept of a Trigger Chain Job.

A Trigger Chain Job (Option B) allows administrators to define a sequence of jobs where one job is automatically triggered upon the successful completion of another. In this scenario, once the User Import Job finishes, the system can automatically trigger the Provisioning Job, ensuring seamless and immediate execution without manual intervention or time delays.

Option A (Multi-threading job) relates to performance optimization, not sequencing. Option C (Single Threaded Job) defines execution style but does not control job dependency. Option D (WSRetry job) is used for retrying failed web service calls, not for chaining processes.

Thus, Trigger Chain Job is the correct approach for automating dependent job execution and is widely used in Saviynt for efficient
