Almost everyone is trying to get CompTIA DataSys+ Certification Exam (DS0-001) certification to update their CV or get the desired job. Nowadays, everyone is interested in taking the CompTIA DataSys+ Certification Exam (DS0-001) exam because it has multiple benefits for the future. Every candidate faces just one problem, and that is not getting updated CompTIA DataSys+ Certification Exam (DS0-001) practice questions.

CompTIA DataSys+ Certification Exam Sample Questions (Q62-Q67):

NEW QUESTION # 62

Which of the following cloud delivery models is typically used in environments where organizations delegate control of runtimes, middleware, and compute resources that focus mostly on applications?

- A. PaaS
- B. IaaS
- C. DBaaS
- D. SaaS

Answer: A

Explanation:

Platform as a Service (PaaS) provides environments where organizations manage applications while the provider controls runtimes, middleware, and compute resources.

NEW QUESTION # 63

Which of the following is the deployment phase in which a DBA ensures the most recent patches are applied to the new database?

- A. Provisioning
- B. Upgrading
- C. Modifying
- D. Importing

Answer: B

Explanation:

The deployment phase in which a DBA ensures the most recent patches are applied to the new database is upgrading. Upgrading is a process that updates an existing database system or software to a newer version or release that may include new features, enhancements, bug fixes, security patches, etc. Upgrading helps improve the performance, functionality, compatibility, and security of the database system or software. Upgrading can be done manually or automatically using tools or scripts provided by the vendor or developer. Upgrading can also involve testing, backup, migration, or rollback procedures to ensure the quality and reliability of the new version or release. The other options are either different deployment phases or not related to deployment at all. For example, importing is a process that transfers data from one source to another using files or formats; provisioning is a process that allocates resources such as servers, storage, network, etc., for a system or software; modifying is a process that changes existing data or objects in a database using commands or scripts.

NEW QUESTION # 64

A developer is designing a table that does not have repeated values. Which of the following indexes should the developer use to prevent duplicate values from being inserted?

- A. Implicit
- **B. Unique**
- C. Composite
- D. Single column

Answer: B

Explanation:

The index that the developer should use to prevent duplicate values from being inserted is unique. A unique index is a type of index that enforces the uniqueness of the values in one or more columns of a table. A unique index ensures that no two rows in the table have the same value or combination of values in the indexed columns. A unique index helps to maintain data integrity and avoid data duplication or inconsistency. The other options are either not related or not effective for this purpose. For example, a single column index is a type of index that involves only one column of a table, but it does not prevent duplicate values unless it is also unique; an implicit index is a type of index that is automatically created by the database system when a constraint or a primary key is defined on a column or columns of a table, but it does not prevent duplicate values unless it is also unique; a composite index is a type of index that involves two or more columns of a table, but it does not prevent duplicate values unless it is also unique. NEW QUESTION # 65

Which of the following is the best to consult in order to start the recovery process after a disaster?

- A. Data dictionary
- B. Entity relations diagram
- C. Build documentation
- **D. Transaction logs**

Answer: D

Explanation:

Transaction logs record all database changes and are essential for restoring data to a consistent state during the recovery process after a disaster.

NEW QUESTION # 66

A database administrator would like to extract a sales performance report from more than one database instance. Which of the following keywords should the database administrator use?

- A. UNION AND
