Scaled Agile SAFe Release Train Engineer Sample Questions (Q159-Q164):

NEW QUESTION # 159

Which three topics are covered on the first day of the Program Increment (PI) Planning event? (Choose three.)

- A. Ishikawa diagrams
- B. Cumulative flow diagrams
- C. Team velocity Metrics
- D. Architecture Vision and development practices
- E. Product/Solution Vision
- F. Business context

Answer: D,E,F

Explanation:

The first day of the Program Increment (PI) Planning event covers several critical topics that align the Agile Release Train (ART) to a shared mission and vision. The key topics covered include:

* Business Context: This provides the teams with an understanding of the market, the customer needs, and the business objectives that are driving the ART1.

* Product/Solution Vision: The vision is presented to inspire and provide a big-picture view of the product or solution to be developed, setting the stage for the planning activities1.

* Architecture Vision and Development Practices: This includes the presentation of the architectural vision and the development

practices that will guide the teams during the PI. It ensures that everyone understands the technical direction and the development guidelines¹.

These topics are essential for establishing a clear direction and alignment among all team members and stakeholders. They help in building the social network the ART depends upon and aligning development to business goals. The RTE facilitates this event, which includes all members of the ART and occurs within the Innovation and Planning (IP) Iteration¹. The discussions on these topics enable the teams to create their Iteration plans and objectives for the upcoming PI effectively.

NEW QUESTION # 160

What is a common reason why a team is unable to estimate a story?

- A. The story lacks acceptance criteria
- B. The story does not include a role
- C. The team has no experience in estimating
- D. The team does not understand the tasks related to the story

Answer: A

Explanation:

In the context of SAFe, a user story is a short description of a small piece of desired functionality written from the user's perspective. For a team to estimate a story effectively, it needs to have clear acceptance criteria that define the boundaries and requirements of the story. Acceptance criteria are essential for understanding what is expected to be delivered and for determining the effort required to complete the story.

Without acceptance criteria, the team may struggle to understand the full scope of the story, leading to challenges in estimation. This is supported by the information found in the SAFe documentation, which emphasizes the importance of acceptance criteria in defining and understanding user stories within the framework¹.

NEW QUESTION # 161

Which two items should be kept under version control? (Choose two.)

- A. Archived User Stories
- B. Weighted shortest job first outcomes
- C. Test data
- D. Configuration Items
- E. Scrum of scrum results

Answer: C,D

Explanation:

In the context of SAFe 6.0, version control is a critical practice that supports Continuous Deployment (CD) and, by extension, the entire Continuous Delivery Pipeline (CDP). The items that should be kept under version control include:

* Test data: Keeping test data under version control is essential for maintaining consistency across different environments and ensuring that tests can be reliably repeated. This is important for validating the functionality and performance of the system as changes are made over time.

* Configuration Items: Configuration items include all the components of the infrastructure and code that are necessary to create a consistent and repeatable deployment process. By maintaining these items under version control, teams can quickly rollback changes if needed and have a clear history of changes to the system's configuration¹.

Version control is not just about tracking changes to code; it also encompasses the environments and the various elements that contribute to the deployment pipeline. This ensures that every aspect of the software delivery process is reproducible, auditable, and reversible, which is a cornerstone of Agile and DevOps practices within SAFe¹.

NEW QUESTION # 162

What is an anti-pattern for a Release Train Engineer facilitating a scrum of scrums meet-ing?

- A. Facilitate the meeting using a focused and visible agenda and timebox
- B. Run the meeting in front of the program board
- C. Address the most important questions for Program Increment (PI) execution
- D. Review individual team performance

Answer: D

Explanation:

An anti-pattern for a Release Train Engineer (RTE) facilitating a scrum of scrums meeting is focusing on individual team performance. The purpose of the scrum of scrums is to enhance collaboration and alignment across teams, not to assess or review the performance of individual teams.

* Purpose of Scrum of Scrums: The scrum of scrums is a coordination meeting that helps teams discuss interdependencies and progress towards achieving the Program Increment (PI) objectives. It is not a status meeting or a performance review session.

* Role of the RTE: As a servant leader, the RTE's role is to facilitate these meetings to ensure that teams are on track to meet the PI objectives, not to evaluate team performance. The RTE should focus on removing impediments and fostering an environment where teams can collaborate effectively.

* Focus on Collaboration: The RTE should encourage teams to share information about their progress, impediments, and dependencies, rather than focusing on individual team metrics or performance. This approach promotes a collaborative and problem-solving culture.

* Anti-Patterns to Avoid: Reviewing individual team performance can lead to a lack of trust and openness, as teams may feel they are being judged or compared. This can hinder the collaborative spirit necessary for the success of the ART.

* Encouraging System Thinking: The RTE should promote system thinking, where the focus is on the overall success of the ART rather than the performance of individual teams. This helps in identifying systemic issues and working towards collective improvement.

In conclusion, the RTE should avoid the anti-pattern of reviewing individual team performance during the scrum of scrums meeting. Instead, the RTE should facilitate a collaborative environment that focuses on the progress and impediments related to PI execution.
