So we can say that the UiPath-ADPv1 practice questions are the top-notch UiPath (ADPv1) Automation Developer Professional (UiPath-ADPv1) dumps that will provide you with everything that you must need for instant UiPath UiPath-ADPv1 exam preparation. Take the right decision regarding your quick UiPath (ADPv1) Automation Developer Professional (UiPath-ADPv1) exam questions preparation and download the real, valid, and updated UiPath-ADPv1 exam dumps and start this journey.

UiPath UiPath-ADPv1 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">• UiPath Activities: In this section, the discussion is related to various UiPath activities for UI interaction, data manipulation, control flow, and more.
Topic 2	<ul style="list-style-type: none">• Debugging and Testing: This section is about utilizing logging and debugging tools and adopting unit testing and test automation strategies.
Topic 3	<ul style="list-style-type: none">• Design and Development: This section covers designing workflows using sequences, flowcharts, and state machines, building reusable components with libraries, exception handling and debugging techniques, etc.

Topic 4

- UiPath Studio Fundamentals: In this section, the focus is given to the understanding of Robotic Process Automation (RPA) concepts; it covers UiPath Studio and its components, Working with the UiPath user interface, project creation, management, and version control.

Clear the UiPath UiPath-ADPv1 Exam with Actual4Cert

The update for our UiPath-ADPv1 learning guide will be free for one year and half price concession will be offered one year later. In addition to the constantly update, we have been working hard to improve the quality of our UiPath-ADPv1 Preparation prep. I believe that with the help of our study materials, the exam is no longer an annoyance. Hope you can give not only our UiPath-ADPv1 training materials but also yourself a chance.

UiPath (ADPv1) Automation Developer Professional Sample Questions (Q15-Q20):

NEW QUESTION # 15

Where is the TransactionNumber incremented in the REFramework?

- A. In the RetryCurrentTransaction.xaml workflow and in the SetTransactionStatus.xaml workflow.
- B. Only in the RetryCurrentTransaction.xaml workflow.
- C. In the New Transaction transition.
- D. Only in the SetTransactionStatus.xaml workflow.

Answer: D

NEW QUESTION # 16

What is the main function of the UiPath Remote Runtime component?

- A. It enables the use of OCR and image recognition activities on remote applications or desktops, without any extensions, allowing selectors to be natively generated in UiExplorer.
- B. It facilitates the communication between a remote application or desktop and the dedicated UiPath extension, allowing selectors to be natively generated in UiExplorer.
- C. It introduces support for headless browser automation, so browser automation doesn't necessarily have to rely on visual elements on screen, such as window frames.
- D. It allows automations to run on the user machine, in a different Windows session.

Answer: B

Explanation:

The UiPath Remote Runtime component is a component that facilitates the communication between a remote application or desktop, such as Citrix Virtual Apps, and the dedicated UiPath extension - the UiPath Extension for Citrix, the UiPath Extension for Windows Remote Desktop and Apps, or the UiPath Extension for VMware Horizon1. It gathers information about the targeted UI elements of the remote applications and sends them to the corresponding extension, so that selectors are natively generated in UiExplorer1. The UiPath Remote Runtime component is required to establish the connection between an application or desktop server and a corresponding UiPath extension installed on a client machine, where Studio is installed1. This way, selectors are natively generated on the client machine, without having to rely on OCR and image recognition activities1. .

NEW QUESTION # 17

Considering a process developed using REFramework, if the status of a transaction was set to "Failed" with the ErrorType specified as "Business", the process will transition to which state?

- A. Get Transaction Data
- B. End Process
- C. Initialization

- D. Process Transaction

Answer: A

Explanation:

The REFramework is a project template based on State Machines, which follows the best practices regarding logging, exception handling, application initialization, and others¹. The REFramework uses a queue in Orchestrator to store the transaction items, which are the units of data that need to be processed by the automation process¹. The status of a transaction item can be set to Failed or Successful using the Set Transaction Status activity, which also allows specifying the ErrorType as Business or Application². A Business ErrorType indicates that the transaction failed due to a business rule exception, such as invalid or incomplete data². An Application ErrorType indicates that the transaction failed due to an application exception, such as a system error or a timeout². The REFramework has four main states: Init, Get Transaction Data, Process Transaction, and End Process¹.

The process transitions between these states based on the conditions and triggers defined in the state machine¹.

The process starts with the Init state, where the application is initialized and the Config file is read¹. Then, the process moves to the Get Transaction Data state, where the next transaction item is retrieved from the queue¹.

If there is a transaction item available, the process moves to the Process Transaction state, where the main logic of the automation is executed¹. If the transaction is processed successfully, the status is set to Successful and the process returns to the Get Transaction Data state¹. If the transaction fails due to a Business ErrorType, the status is set to Failed and the process also returns to the Get Transaction Data state, without retrying the transaction¹. If the transaction fails due to an Application ErrorType, the status is set to Failed and the process retries the transaction until the maximum number of retries is reached¹. If there is no transaction item available, or if the maximum number of retries is reached, or if a System Error occurs, the process moves to the End Process state, where the application is closed and the final report is generated¹.

Therefore, considering a process developed using REFramework, if the status of a transaction was set to "Failed" with the ErrorType specified as "Business", the process will transition to the Get Transaction Data state, where it will fetch the next transaction item from the queue.

NEW QUESTION # 18

What is a pre-requisite for running functional test cases in REFramework?

- A. Invoke SetTransactionStatus XAML file
- B. Invoke Process XAML file
- C. Invoke InitAllSettings XAML file
- D. Invoke Main XAML file

Answer: C

NEW QUESTION # 19

Which major sections can be added or modified in the State activity of a UiPath project that uses State Machines?

- A. Entry actions, Exit actions, Conditional expressions, and Transitions.
- B. Entry actions, Exit actions, Guard and Trigger attributes, and Transitions.
- C. Entry actions, Exit actions, Guard conditions, and Transitions.
- D. Entry actions, Exit actions, Trigger conditions, and Transitions.

Answer: C

Explanation:

The State activity is a container for using State Machine specific activities. It can be added or modified in the State Machine activity, which is a type of automation that uses a finite number of states in its execution¹. The State activity contains three major sections: Entry, Exit, and Transition(s)².

The Entry section enables the user to add entry actions for the selected state, which are executed when the state is entered.

The Exit section enables the user to add exit actions for the selected state, which are executed when the state is exited.

The Transition(s) section displays all the transitions linked to the selected state, which are represented by arrows or branches between states. Each transition can be expanded to view or edit its three subsections: Trigger, Condition, and Action².

The Trigger subsection enables the user to add a trigger for the next state, which is an activity that initiates the transition.

The Condition subsection enables the user to add a guard condition for the transition, which is a Boolean expression that must be true for the transition to occur.

The Action subsection enables the user to add an action for the transition, which is an activity or sequence that is executed before the transition occurs.

Option D is the correct answer, as it lists the major sections that can be added or modified in the State activity of a UiPath project that uses State Machines. Option A is incorrect, as there is no Conditional expressions section in the State activity. Option B is incorrect, as there are no Guard and Trigger attributes sections in the State activity, but rather subsections in the Transition(s) section. Option C is incorrect, as there is no Trigger conditions section in the State activity, but rather a subsection in the Transition(s) section.
