Fortinet NSE 4 - FortiOS 7.6 Administrator Sample Questions (Q90-Q95):

NEW QUESTION # 90

What are two features of collector agent advanced mode? (Choose two.)

- A. In advanced mode, security profiles can be applied only to user groups, not individual users.
- B. In advanced mode, FortiGate can be configured as an LDAP client and group filters can be configured on FortiGate.
- C. Advanced mode supports nested or inherited groups.
- D. Advanced mode uses the Windows convention -NetBios: Domain\Username.

Answer: B,C

Explanation:

Also, advanced mode supports nested or inherited groups; that is, users can be members of subgroups that belong to monitored parent groups.

In advanced mode, you can configure FortiGate as an LDAP client and configure the group filters on FortiGate. You can also configure group filters on the collector agent.

NEW QUESTION # 91

A network administrator has enabled full SSL inspection and web filtering on FortiGate. When visiting any HTTPS websites, the browser reports certificate warning errors. When visiting HTTP websites, the browser does not report errors.

What is the reason for the certificate warning errors?

- A. The browser does not trust the certificate used by FortiGate for SSL inspection.
- B. The certificate used by FortiGate for SSL inspection does not contain the required certificate extensions.
- C. The matching firewall policy is set to proxy inspection mode.
- D. The option invalid SSL certificates is set to allow on the SSL/SSH inspection profile

Answer: A

Explanation:

When full SSL inspection is enabled, FortiGate decrypts and re-signs HTTPS traffic using its own SSL inspection certificate. If the FortiGate CA certificate is not imported and trusted by the client's browser or OS, the browser sees it as untrusted and displays certificate warning errors. HTTP traffic is unaffected since it does not use certificates.

NEW QUESTION # 92

Refer to the exhibit.

| Profile Name |
|-------------------|
| Monitoring_Access |
| NOC_Access |
| prof_admin |
| super_admin |

The NOC team connects to the FortiGate GUI with the NOC_Access admin profile. They request that their GUI sessions do not disconnect too early during inactivity. What must the administrator configure to answer this specific request from the NOC team? (Choose one answer)

- A. Move NOC_Access to the top of the list to ensure all profile settings take effect.
- **B. Increase the admintimeout value under config system accprofile NOC_Access.**
- C. Increase the offline value of the Override Idle Timeout parameter in the NOC_Access admin profile.
- D. Ensure that all NOC_Access users are assigned the super_admin role to guarantee access.

Answer: B

Explanation:

According to the FortiOS 7.6 Administrator Study Guide, while there is a global administrative idle timeout setting that applies to all users by default (typically 5 minutes), FortiOS allows for granular control through Administrator Profiles. The Override Idle Timeout feature is specifically designed to allow different timeout values for different access profiles, which is ideal for environments like a Network Operations Center (NOC) where persistent monitoring is required.²³ To implement this, the administrator must modify the specific access profile settings. By using the command `config system accprofile 5` and editing the NOC_Access profile, the administrator can enable the `admintimeout-override` and then increase the `admintimeout` value (Statement D). This configuration ensures that only the users assigned to that specific profile benefit from the extended session duration, maintaining a higher security posture for other administrative accounts that still follow the global timeout. Other options, such as changing the profile order (A) or assigning the super_admin role (C), do not address the specific requirement for inactivity timeout management. Option B is incorrect as "offline value" is not a standard parameter for this feature.

NEW QUESTION # 93

Refer to the exhibit. Which algorithm does SD-WAN use to distribute traffic that does not match any of the SD-WAN rules?

| ID | Name | Source | Destination | Criteria | Members |
|-----------------|------------------|--------------|---|-----------------------|----------------|
| IPv4 | | | | | |
| 1 | Critical-DIA | LOCAL_SUBNET | Slack-Slack Dropbox-Web Bloomberg | | port1 port2 |
| 2 | Non-Critical-DIA | LOCAL_SUBNET | Addicting-Games Social.Media | Bandwidth | port2 |
| 3 | Default-Internet | LOCAL_SUBNET | REMOTE_SUBNET | Latency | port1 port2 |
| Implicit | | | | | |
| | sd-wan | all | all | Source-Destination IP | any |

- A. Traffic is distributed based on the number of sessions through each interface.

- B. Traffic is sent to the link with the lowest latency.
- C. All traffic from a source IP is sent to the same interface
- D. All traffic from a source IP to a destination IP is sent to the same interface.

Answer: D

Explanation:

For traffic that does not match any of the defined SD-WAN rules, the default implicit SD-WAN rule is applied. By default, the FortiGate uses a "source-destination IP-based" algorithm, which means all traffic from a specific source IP to a specific destination IP is sent through the same interface.

This ensures that a consistent path is used for traffic between the same source and destination IP addresses.

NEW QUESTION # 94

A network administrator has enabled full SSL inspection and web filtering on FortiGate. When visiting any HTTPS websites, the browser reports certificate warning errors. When visiting HTTP websites, the browser does not report errors.

What is the reason for the certificate warning errors?

- A. The browser does not trust the certificate used by FortiGate for SSL inspection.
- B. The certificate used by FortiGate for SSL inspection does not contain the required certificate extensions.
- C. The matching firewall policy is set to proxy inspection mode.
- D. The option invalid SSL certificates is set to allow on the SSL/SSH inspection profile

Answer: A

Explanation:

The browser presents a certificate warning when you attempt to access an HTTPS site that uses an untrusted certificate. Untrusted certificates include self-signed SSL certificates, unless the certificate is imported into the browser-trusted certificate store. FortiGate has its own configuration setting on the SSL/SSH Inspection profile, which includes options to Allow, Block, or Ignore untrusted SSL certificates.
