Microsoft AZ-400 (Designing and Implementing Microsoft DevOps Solutions) Exam is a certification exam that focuses on testing the skills and knowledge of professionals who are responsible for designing and implementing DevOps solutions in a Microsoft environment. AZ-400 exam tests the candidate's ability to implement continuous integration and continuous delivery, manage source control, monitor and optimize solutions, implement security and compliance, and manage infrastructure and configuration.

Microsoft AZ-400: Designing & Implementing Microsoft DevOps Solutions is a qualifying exam required for obtaining the Microsoft Certified: DevOps Engineer Expert certification. This test is designed to measure the competence of the candidates in developing instrumentation strategies; developing an SRE (Site Reliability Engineering) strategy; developing a compliance and security plan; defining and implementing a continuous delivery & release management strategy; defining and implementing continuous integration; facilitating collaboration and communication; handling source control.

Microsoft Designing and Implementing Microsoft DevOps Solutions Sample Questions (Q566-Q571):

NEW QUESTION # 566

HOTSPOT

You have an Azure virtual machine named VM1 that runs Linux.

You plan to deploy the Desired State Configuration (DSC) extension to VM1.

You need to grant the Log Analytics agent the appropriate directory permissions.

How should you complete the command? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

□

Answer:

Explanation:

Explanation:

Box 1: rwx

The Log Analytics agent for Linux runs as the omsagent user. To grant >write permission to the omsagent user, run the command `setfacl -m u:omsagent:rwx /tmp`.

Box 2: /tmp

Deploying DSC to a Linux node uses the /tmp folder.

NEW QUESTION # 567

You create a Git repository named Repo1 in Azure Repos.

You need to configure Repo1 to meet the following requirements:

*Work items must be linked to a pull request.

*Pull requests must have a minimum of two reviewers.

* Pull requests must complete a code review by using a third-party tool.

The solution must minimize administrative effort.

Which type of policy should you use for each requirement? To answer, drag the appropriate policy type to the correct requirements.

Each policy type may be used once, more than once, or not at all.

You may need to drag the split bar between panes or scroll to view content.

Answer:

Explanation:

Explanation

NEW QUESTION # 568

You have a project in Azure DevOps that uses packages from multiple public feeds. Some of the feeds are unreliable.

You need to consolidate the packages into a single feed.

Which three actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Answer:

Explanation:

Explanation

Step 1: Create a NuGet package.

NuGet and Maven are public package managers that support multiple feeds.

Step 2: Create an Azure Artifacts feed that uses upstream sources

If you want to use packages from multiple feeds, use upstream sources to bring packages from multiple feeds together into a single feed.

Step 3: Create a Microsoft Visual Studio project that includes all the packages. Consume NuGet packages from upstream sources:

Now you can open Visual Studio and install packages from the upstream sources you just configured.
