Top PAP-001 Valid Exam Experience & Leading Provider in Qualification Exams & Effective Latest PAP-001 Exam Price

The 24/7 support team is just an e-mail away for our customers so that they can contact us anytime. Our team will solve all of their issues as quickly as possible. Free demos and up to 1 year of free updates of our Ping Identity Exams are also available at RealValidExam. Buy updated and Real PAP-001 Exam Questions now and earn your dream PAP-001 certification with RealValidExam!

Ping Identity PAP-001 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">• Policies and Rules: This section of the exam measures the skills of Security Administrators and focuses on how PingAccess evaluates paths for applying policies and resources. It covers the role of different rule types, their configuration, and the implementation of rule sets and rule set groups for consistent policy enforcement.
Topic 2	<ul style="list-style-type: none">• General Maintenance and File System: This section of the exam measures the skills of System Engineers and addresses maintenance tasks such as license management, backups, configuration imports or exports, auditing, and product upgrades. It also includes the purpose of log files and an overview of the PingAccess file system structure with important configuration files.

Topic 3	<ul style="list-style-type: none"> • Integrations: This section of the exam measures skills of System Engineers and explains how PingAccess integrates with token providers, OAuth and OpenID Connect configurations, and site authenticators. It also includes the use of agents and securing web, API, and combined applications through appropriate integration settings.
Topic 4	<ul style="list-style-type: none"> • General Configuration: This section of the exam measures skills of Security Administrators and introduces the different object types within PingAccess such as applications, virtual hosts, and web sessions. It explains managing application resource properties, creating web sessions, configuring identity mappings, and navigating the administrative console effectively.
Topic 5	<ul style="list-style-type: none"> • Installation and Initial Configuration: This section of the exam measures skills of System Engineers and reviews installation prerequisites, methods of installing or removing PingAccess, and securing configuration database passwords. It explains the role of run.properties entries and outlines how to set up a basic on-premise PingAccess cluster.

Ping Identity Certified Professional - PingAccess Sample Questions (Q46-Q51):

NEW QUESTION # 46

Where should an administrator adjust SameSite Cookie settings?

- A. Web Sessions
- B. Applications
- C. Sites
- D. Rules

Answer: A

Explanation:

The SameSite attribute is applied to session cookies to control cross-site behavior. In PingAccess, session cookie configuration (including SameSite) is defined at the Web Session level.

Exact Extract:

"Web session configuration includes cookie attributes such as name, domain, secure flag, HTTPOnly, and SameSite."

- * Option A (Rules) is incorrect - rules govern access control, not cookies.
- * Option B (Sites) defines backend connections, not session cookies.
- * Option C (Applications) ties resources to sessions but does not define cookie behavior.
- * Option D (Web Sessions) is correct - session cookie SameSite settings are configured here.

Reference: PingAccess Administration Guide - Web Session Cookies

NEW QUESTION # 47

An organization has a highly available PingAccess cluster with four runtime nodes. The administrator wants to provide the same availability to administrative users. What should the administrator do?

- A. Configure two active administrative nodes with engine cluster pointed to both administrative nodes for configuration
- B. Configure four active administrative nodes with engine cluster pointed to all administrative nodes for configuration
- C. Configure one active and one replica administrative node with engine cluster pointed to both administrative nodes
- D. Configure one active and three replica administrative nodes with engine cluster pointed to all administrative nodes

Answer: D

Explanation:

PingAccess supports one primary administrative console (active) and any number of replica administrative consoles. Engines must be

configured to connect to the active console, with replicas available for failover.

Exact Extract:

"In a clustered environment, PingAccess supports one clustered console (active) and replica consoles. Engines can connect to any console node for high availability."

- * Option A is incomplete - only one replica limits redundancy.
- * Option B is incorrect - multiple active consoles are not supported.
- * Option C is incorrect - cannot run two active consoles.
- * Option D is correct - one active admin console with multiple replicas ensures HA.

Reference: PingAccess Administration Guide - Clustered Console and Replica Configuration

NEW QUESTION # 48

All access requests to the existing/admin resource must be captured in the audit log. How should this be accomplished?

- A. Set Splunk audit logging for/admin
- B. Set log4j2.xml audit logging for/admin
- C. Enable the Audit option for the /* resource
- **D. Enable the Audit option for the/admin resource**

Answer: D

Explanation:

PingAccess resources have an Audit flag. When enabled, all access attempts (allowed or denied) are recorded in the audit logs.

Exact Extract:

"To audit access requests to a specific resource, enable the Audit option on that resource in the application configuration."

- * Option A is correct - enabling audit for/admin ensures its access requests are logged.
- * Option B is incorrect - enabling audit for /* is overly broad and logs everything, not just/admin.
- * Option C is incorrect - Splunk integration is for log forwarding, not per-resource auditing.
- * Option D is incorrect - log4j2.xml controls log destinations/levels, not resource-specific auditing.

Reference: PingAccess Administration Guide - Resource Audit Logging

NEW QUESTION # 49

An internal audit reveals that an agent has been compromised. What action must be taken to re-secure the agent?

- **A. Download and apply a new agent.properties file**
- B. Select a new Agent Trusted Certificate
- C. Reinstall the agent
- D. Change the agent.engine.configuration.shared.secretvalue in the agent.properties file

Answer: A

Explanation:

When a PingAccess agent is compromised, the secure approach is to invalidate the existing credentials and issue a new configuration file from the PingAccess Admin Console. This provides a fresh agent.properties file with new secrets, ensuring compromised keys cannot be reused.

Exact Extract:

"If an agent is compromised, revoke and regenerate the agent configuration by downloading a new agent.properties file from the administrative console."

- * Option A is incorrect - manually changing the secret in the file does not propagate it to PingAccess.
- * Option B is incorrect - trusted certificates are not tied to agent authentication.
- * Option C is unnecessary - reinstalling the agent does not reset credentials.
- * Option D is correct - downloading a new agent.properties file re-secures the agent.

Reference: PingAccess Administration Guide - Agent Management

NEW QUESTION # 50

An API is hosted onsite and is using only header-based Identity Mapping. It is exposed to all clients running on the corporate network. How should the administrator prevent a malicious actor from bypassing PingAccess and spoofing the headers to gain unauthorized access to the API?

- A. Require HTTPS
- **B. Use ID Tokens**
- C. Add Site Authenticator
- D. Use Target Host Header

Answer: B

Explanation:

When applications depend solely on header-based identity mapping, attackers can attempt to bypass PingAccess by injecting headers directly into requests sent to the backend. To prevent spoofing, PingAccess should be configured to pass cryptographically verifiable tokens (e.g., ID tokens from OIDC) instead of relying on plain headers.

Exact Extract:

"Headers can be spoofed if not protected. Use signed tokens, such as ID tokens or JWTs, to provide strong identity assurance and prevent header injection attacks."

* Option A (Use ID Tokens) is correct - ID tokens are signed and verifiable, preventing spoofing.

* Option B (Add Site Authenticator) protects PingAccess-to-site authentication, not client-to-API spoofing.

* Option C (Require HTTPS) prevents eavesdropping but does not stop header spoofing from inside the network.

* Option D (Use Target Host Header) ensures host header integrity but not user identity.
