HOT Actual CAS-004 Tests 100% Pass | Trustable CompTIA CompTIA Advanced Security Practitioner (CASP+) Exam Guaranteed Success Pass for sure

In this circumstance, if you are the person who is willing to get CAS-004 exam prep, our products would be the perfect choice for you. Here are some advantages of our CAS-004 exam prep, our study materials guarantee the high-efficient preparing time for you to make progress is mainly attributed to our marvelous organization of the content and layout which can make our customers well-focused and targeted during the learning process. If you are interested our CAS-004 Guide Torrent, please contact us immediately, we would show our greatest enthusiasm to help you obtain the certification.

CompTIA Advanced Security Practitioner (CASP+) Exam Sample Questions (Q194-Q199):

NEW QUESTION # 194

An organization needs to disable TLS 1.0 on a retail website. Which of the following best explains the reason for this action?

- A. Payment card industry compliance requires the change.
- B. Most browser manufacturers are ending legacy support.
- C. The application software no longer supports TLS 1.0.
- D. Digital certificates are dependent on a newer protocol.

Answer: A

NEW QUESTION # 195

A company security engineer arrives at work to face the following scenario:

- 1) Website defacement
- 2) Calls from the company president indicating the website needs to be fixed immediately because it is damaging the brand
- 3) A job offer from the company's competitor
- 4) A security analyst's investigative report, based on logs from the past six months, describing how lateral movement across the network from various IP addresses originating from a foreign adversary country resulted in exfiltrated data. Which of the following threat actors is MOST likely involved?

- A. APT/nation-state
- B. Competitor
- C. Script kiddie
- D. Organized crime

Answer: A

Explanation:

Explanation

An Advanced Persistent Threat (APT) is an attack that is targeted, well-planned, and conducted over a long period of time by a nation-state actor. The evidence provided in the scenario indicates that the security analyst has identified a foreign adversary, which is strong evidence that an APT/nation-state actor is responsible for the attack. NEW QUESTION # 196

An auditor is reviewing the logs from a web application to determine the source of an incident. The web application architecture includes an Internet-accessible application load balancer, a number of web servers in a private subnet, application servers, and one database server in a tiered configuration. The application load balancer cannot store the logs. The following are sample log snippets:

Which of the following should the auditor recommend to ensure future incidents can be traced back to the sources?

- A. Install a software-based HIDS on the application servers.
- B. Enable the x-Forwarded-For header at the load balancer.
- C. Store the value of the \$_SERVER['REMOTE_ADDR'] received by the web servers.
- D. Use stored procedures on the database server.
- E. Install a certificate signed by a trusted CA.

Answer: E

NEW QUESTION # 197

An IT director is working on a solution to meet the challenge of remotely managing laptop devices and securely locking them down. The solution must meet the following requirements:

- * Cut down on patch management.
- * Make use of standard configurations.

- * Allow for custom resource configurations.
 - * Provide access to the enterprise system from multiple types of devices.
- Which of the following would meet these requirements?

- A. Hosted hypervisor
- B. Emulator
- C. MDM
- **D. VDI**

Answer: D

Explanation:

A Virtual Desktop Infrastructure (VDI) solution meets all the listed requirements: reducing patch management, using standard configurations, allowing for custom resource configurations, and providing access from multiple device types. VDI allows centralized management of desktop environments, where patches and updates can be applied once and distributed across all virtual desktops. It also supports flexible resource configurations and secure remote access from various devices. CASP+ highlights VDI as a solution for centralized, secure desktop management that meets modern enterprise needs for mobility and security.

NEW QUESTION # 198

An engineering team has deployed a new VPN service that requires client certificates to be used in order to successfully connect. On iOS devices, however, the following error occurs after importing the .p12 certificate file:

mbedTLS: ca certificate undefined

Which of the following is the root cause of this issue?

- A. The VPN client configuration is missing the CA private key.
- **B. The iOS keychain imported only the client public and private keys.**
- C. OpenSSL is not configured to support PKCS#12 certificate files.
- D. iOS devices have an empty root certificate chain by default.

Answer: B

Explanation:

The root cause of this issue is that the iOS keychain imported only the client public and private keys, but not the CA certificate. A PKCS#12 file (.p12 or .pfx) is a file format that contains a certificate and its private key, optionally protected by a password. A PKCS#12 file can also contain intermediate certificates or root certificates that are needed to verify the certificate chain. However, when importing a PKCS#12 file into the iOS keychain, only the certificate and its private key are imported, not the CA certificate. This means that the iOS device cannot verify the authenticity of the certificate, and displays the error message "mbedTLS: ca certificate undefined". To fix this issue, the CA certificate needs to be imported separately into the iOS keychain, either manually or using a configuration profile. Verified Reference:
