Candidates who become WGU Web-Development-Applications certified demonstrate their worth in the WGU field. The WGU Web Development Applications (Web-Development-Applications) certification is proof of their competence and skills. This is a highly sought-after skill in large WGU companies and makes a career easier for the candidate. To become certified, you must pass the WGU Web Development Applications (Web-Development-Applications) certification exam. For this task, you need high-quality and accurate WGU Web Development Applications (Web-Development-Applications) exam dumps.

WGU Web-Development-Applications Exam Syllabus Topics:

Topic	Details
Topic 1	HTML5, CSS3, and JavaScript Foundations: This section of the exam measures skills of Web Developers and covers the essential ability to manually code using HTML5, CSS3, and JavaScript to create structured, visually styled, and interactive web content. It focuses on building accurate page layouts, applying modern styling rules, and writing basic scripts that support user interaction. The aim is to ensure candidates can construct professional web documents using current standards and properly integrate all three technologies.
Topic 2	Responsive Web Design (RWD) for Browsers and Apps: This section of the exam measures skills of Front-End Designers and covers concepts related to mobile-first layout planning, responsive frameworks, and techniques used to ensure compatibility with modern browsers and applications. Candidates must demonstrate how to adjust elements for better usability on mobile devices and apply responsive strategies that allow a single design to function seamlessly across various environments.

Topic 3	• Creating Adaptive Web Documents and Pages: This section of the exam measures skills of Front-End Designers and covers the techniques needed to make websites display correctly across traditional desktops and mobile devices. It emphasizes adaptive page layout, flexible formatting, and user-friendly presentation so that content remains readable and functional on screens of different sizes. Candidates are expected to show an understanding of how to create consistent designs that respond smoothly to device changes.
Topic 4	• Validation, Testing, and Form Development: This section of the exam measures skills of Web Developers and covers the ability to validate code, test web pages for accuracy, and build form components. It includes understanding how to detect errors, ensure compliance with standards, and implement form fields with inline validation to improve user experience. The focus is on creating forms that work reliably, meet usability expectations, and maintain proper data entry flow.

WGU Web Development Applications Sample Questions (Q74-Q79):

NEW QUESTION # 74

Which attribute is related to moving the mouse pointer of an element?

- A. Onmouseout
- **B. Onmouseover**
- C. onmouseenter
- D. Onmouseup

Answer: B

Explanation:

The onmouseover attribute in HTML and JavaScript is used to execute a script when the mouse pointer is moved over an element.

* onmouseover Attribute: This event occurs when the mouse pointer is moved onto an element. It is commonly used to change styles or content of the element when the user interacts with it by hovering.

* Usage Example:

`<p onmouseover="this.style.color='red'">Hover over this text to change its color to red.</p>` In this example, the text color changes to red when the mouse pointer is moved over the paragraph.

NEW QUESTION # 75

```
.option01 {
text-align: right;
color: red;
}
```

Which HTML markup should a developer use to invoke the option01 selector in a paragraph?

- A. `<p class=.option01>Red color text</p>`
- **B. `<p class="option01">Red color text</p>`**
- C. `<p id="option01">Red color text</p>`
- D. `<p id=.option01>Red color text</p>`

Answer: B

Explanation:

Since the CSS rule uses a class selector .option01, the correct way to apply it in HTML is by setting the class attribute on the element.

Correct HTML:

```
<p class="option01">Red color text</p>
```

"To apply a class selector, add class="classname" to the HTML element. This connects it to CSS rules written with .<classname>."

Here are the properly formatted and verified responses to your Questions 16-18 using the format you requested.

NEW QUESTION # 76

Which element relies on the type attribute to specify acceptable values during form entry?

- A. <Option>
- B. <Button>
- C. <Select>
- D. <input>

Answer: D

Explanation:

The <input> element relies on the type attribute to specify acceptable values during form entry. Different input types include text, email, number, password, etc.

* Input Types: The type attribute determines the kind of input control and the acceptable values for that control.

* Usage Example:

```
<input type="email" placeholder="Enter your email">
```

```
<input type="number" min="1" max="10">
```

These input elements specify acceptable values for email and number inputs respectively.

NEW QUESTION # 77

Which characters are used to enclose multiple statement in a function?

- A. Curly braces
- B. Parentheses
- C. Semicolons
- D. Spaces

Answer: A

Explanation:

In JavaScript, curly braces {} are used to enclose multiple statements in a function, defining the block of code to be executed.

* Curly Braces: Curly braces {} are used to group multiple statements into a single block. This is necessary for defining the body of a function, loops, conditional statements, and other control structures.

* Usage Example:

```
function greet(name) {  
  let greeting = "Hello, " + name;  
  console.log(greeting);  
}
```

In this example, the curly braces enclose the statements that form the body of the greet function.

NEW QUESTION # 78

Which CSS transformation method should a developer use to reposition an element horizontally on the 2-D plane?

- A. Scale(x,y)
- B. Translate(n)
- C. Scalex(n)

- D. Skewx (angle)

Answer: B

Explanation:

The translateX(n) method in CSS is used to move an element horizontally on the 2-D plane by a specified distance. This transformation repositions the element along the X-axis.

* translateX(n) Method: The translateX(n) function moves an element horizontally by n units. Positive values move the element to the right, while negative values move it to the left.

* Usage Example:

```
element {
transform: translateX(100px);
}
```

In this example, the element is moved 100 pixels to the right.

* Properties:

* n: This represents the distance to move the element. It can be specified in various units such as pixels (px), percentages (%), ems (em), etc.
