Confluent's CCDAK exam certification is one of the most valuable contemporary of many exam certification. In recent decades, computer science education has been a concern of the vast majority of people around the world. It is a necessary part of the IT field of information technology. So IT professionals to enhance their knowledge through Confluent CCDAK exam certification. But pass this test will not be easy. So ExamCost Confluent CCDAK Exam Certification issues is what they indispensable. Select the appropriate shortcut just to guarantee success. The ExamCost exists precisely to your success. Select ExamCost is equivalent to choose success. The questions and answers provided by ExamCost is obtained through the study and practice of ExamCost IT elite. The material has the experience of more than 10 years of IT certification.

Confluent CCDAK (Confluent Certified Developer for Apache Kafka Certification Examination) Certification Exam is designed to test the knowledge and skills of developers who work with Apache Kafka. Apache Kafka is a popular distributed streaming platform that is used by many organizations to handle large amounts of data in real-time. The CCDAK certification exam is an industry-recognized certification that validates the expertise of developers in designing, building, and managing Apache Kafka applications.

Confluent Certified Developer for Apache Kafka (CCDAK) Certification Examination is a globally recognized certification for Kafka developers. CCDAK exam is designed to test developers' knowledge and skills in building applications using Apache Kafka. Confluent Certified Developer for Apache Kafka Certification Examination certification provides Kafka developers with a competitive edge in the job market and demonstrates their expertise in building and managing Kafka clusters.

The Confluent Certified Developer for Apache Kafka Certification Examination certification is provided by Confluent, the company behind the Apache Kafka project, and requires passing an online exam that tests the core concepts, implementation, and

management of data streaming applications using Apache Kafka. Confluent Certified Developer for Apache Kafka Certification Examination certification test is designed to challenge the candidates' knowledge of concepts, programming languages, and tools that are commonly used to build data streaming applications.

Confluent CCDAK Exam is Easy with Our Reliable CCDAK Valid Test Tutorial: Confluent Certified Developer for Apache Kafka Certification Examination Efficiently

Our study materials have enough confidence to provide the best CCDAK exam torrent for your study to pass it. With many years work experience, we have fast reaction speed to market change and need. In this way, we have the latest CCDAK guide torrent. You don't worry about that how to keep up with the market trend, just follow us. We can say that our CCDAK Test Questions are the most suitable for examinee to pass the exam, you will never regret to buy it.

Confluent Certified Developer for Apache Kafka Certification Examination Sample Questions (Q12-Q17):

NEW QUESTION # 12

(Your configuration parameters for a Source connector and Connect worker are:

- * `offset.flush.interval.ms=60000`
- * `offset.flush.timeout.ms=500`
- * `offset.storage.topic=connect-offsets`
- * `offset.storage.replication.factor=-1`

Which two statements match the expected behavior?

Select two.)

- A. The connector will commit offsets to the broker default offsets topic.
- **B. The connector will commit offsets to a topic called connect-offsets.**
- C. The connector will wait 500 ms before trying to commit offsets for tasks.
- **D. The offsets topic will use the broker default replication factor.**

Answer: B,D

Explanation:

Apache Kafka Connect stores source connector offsets in a Kafka topic defined by the `offset.storage.topic` configuration. Since this property is explicitly set to `connect-offsets`, Kafka Connect will commit offsets to that topic, making Option C correct.

The `offset.storage.replication.factor` controls how many replicas the offsets topic will have. When this value is set to `-1`, Kafka Connect uses the broker's default replication factor, as documented in the Kafka Connect worker configuration reference.

Therefore, Option A is also correct.

Option B is incorrect because Kafka Connect does not use Kafka's internal consumer offsets topic (`__consumer_offsets`). It always uses the configured offsets topic. Option D is incorrect because `offset.flush`.

`timeout.ms` defines how long Connect will wait for offset commits to complete, not how long it waits before attempting a commit.

The commit interval itself is controlled by `offset.flush.interval.ms` (60 seconds in this case).

Thus, the correct statements that match the expected behavior are A and C.

NEW QUESTION # 13

A Zookeeper configuration has `tickTime` of 2000, `initLimit` of 20 and `syncLimit` of 5. What's the timeout value for followers to connect to Zookeeper?

- A. 20 sec
- **B. 40 sec**
- C. 2000 ms
- D. 10 sec

Answer: B

Explanation:

tick time is 2000 ms, and initLimit is the config taken into account when establishing a connection to Zookeeper, so the answer is $2000 * 20 = 40000 \text{ ms} = 40\text{s}$

NEW QUESTION # 14

You need to configure a sink connector to write records that fail into a dead letter queue topic.

Requirements:

* Topic name: DLQ-Topic

* Headers containing error context must be added to the messages Which three configuration parameters are necessary? (Select three.)

- A. `errors.log.include.messages=true`
- B. `errors.log.enable=true`
- C. `errors.tolerance=all`
- D. `errors.tolerance=none`
- E. `errors.deadletterqueue.context.headers.enable=true`
- F. `errors.deadletterqueue.topic.name=DLQ-Topic`

Answer: C,E,F

Explanation:

To send failed records to a dead letter queue (DLQ), you must configure:

* `errors.tolerance=all`: Tells the connector to not fail on errors but handle them (e.g., send to DLQ).

* `errors.deadletterqueue.topic.name=DLQ-Topic`: Specifies the DLQ topic.

* `errors.deadletterqueue.context.headers.enable=true`: Includes error context in message headers.

From Kafka Connect Error Handling Docs:

"Kafka Connect supports directing problematic records to a separate topic (DLQ) using `errors.*` configs.

Headers can include failure metadata."

Options D, E, F are related to logging, not DLQ behavior.

Reference: [Kafka Connect Configurations > Error Handling](#)

NEW QUESTION # 15

What exceptions may be caught by the following producer? (select two)

```
ProducerRecord<String, String> record =  
new ProducerRecord<>("topic1", "key1", "value1");  
try {  
    producer.send(record);  
} catch (Exception e) {  
    e.printStackTrace();  
}
```

- A. `InvalidPartitionsException`
- B. `BrokerNotAvailableException`
- C. `BufferExhaustedException`
- D. `SerializationException`

Answer: C,D

Explanation:

These are the client side exceptions that may be encountered before message is sent to the broker, and before a future is returned by the `.send()` method.

NEW QUESTION # 16

A kafka topic has a replication factor of 3 and `min.insync.replicas` setting of 1. What is the maximum number of brokers that can be down so that a producer with `acks=all` can still produce to the topic?

- A. 0
- B. 1

- C. 2
- D. 3

Answer: D

Explanation:

Two brokers can go down, and one replica will still be able to receive and serve data

NEW QUESTION # 17

.....

When you follow with our CCDAK exam questions to prepare for your coming exam, you will be deeply touched by the high-quality and high-efficiency. Carefully devised by the professionals who have an extensive research of the CCDAK exam and its requirements, our CCDAK study braindumps are a real feast for all the candidates. And if you want to have an experience with our CCDAK learning guide, you can free download the demos on our website.
