### EMC Dell PowerFlex Operate Exam Sample Questions (Q69-Q74):

#### NEW QUESTION # 69

What is the minimum bandwidth requirement for replicating volumes between PowerFlex clusters?

- A. 100 Mbps
- B. 10 Mbps
- C. 10 Gbps
- D. 1 Gbps

**Answer: A**

Explanation:

\* 100 Mbps: While PowerFlex replication is highly efficient and only sends unique data chunks (deltas), the supported minimum reliable bandwidth for a WAN link between clusters is typically 100 Mbps.

\* Reasoning: Below this speed, even moderate change rates in a production database would likely cause the replication journal to fill up faster than data can be drained to the remote site. This would lead to a "Buffer Full" state, causing the replication to pause or the system to lose its Recovery Point Objective (RPO) compliance.

#### NEW QUESTION # 70

Which feature of PowerFlex is leveraged to expand storage capacity in a cluster?

- A. Fault Sets
- B. Snapshots
- C. Dynamic Node Addition
- D. Shared File Systems

**Answer: C**

Explanation:

PowerFlex is a scale-out architecture.

\* Dynamic Node Addition (Option B): This refers to the ability to add new x86 servers (nodes) to the cluster on the fly. When you add a node with local drives, the PowerFlex software automatically recognizes the new capacity. It then initiates a Rebalance operation, moving data chunks from existing full nodes to the new empty node until usage is uniform across the cluster. This process increases both Storage Capacity and Performance (IOPS/Bandwidth) linearly.

Incorrect Options:

\* Fault Sets (A) organize nodes for availability, they do not add capacity.

\* Snapshots (C) consume capacity.

\* Shared File Systems (D) manage how capacity is accessed (NAS), not the expansion of the raw block layer.

#### NEW QUESTION # 71

What is the default state of snapshots created in PowerFlex?

- A. Read-only
- B. Archived
- **C. Editable**
- D. Active

**Answer: C**

Explanation:

\* Editable (Writable): Unlike many traditional storage arrays where a snapshot is a read-only frozen image requiring a "clone" to become writable, PowerFlex snapshots are fully writable volumes by default.

\* Behavior: Immediately upon creation, a snapshot is mapped as a volume. You can mount it to a host, write new data to it, delete files from it, or format it, without affecting the source parent volume (due to the Redirect-on-Write architecture).

## NEW QUESTION # 72

Which characteristics define a Fault Set in PowerFlex? (Choose two).

- **A. Is limited to a single Protection Domain**
- **B. Ensures data availability during node failure**
- C. Contains metadata for storage pools
- D. Requires a minimum of 3 nodes

**Answer: A,B**

Explanation:

\* Is limited to a single Protection Domain (Option D): A Fault Set is a logical subdivision within a Protection Domain. You cannot span a Fault Set across multiple Protection Domains.

\* Ensures data availability (Option B): The purpose of a Fault Set is to simulate "Rack Awareness." PowerFlex ensures that copies of data (mirrors) are never placed in the same Fault Set. If Fault Set 1 (Rack 1) fails completely, the system guarantees that the secondary copies of that data exist in Fault Set

2 or 3, keeping the data available.

Note on C: While a cluster using Fault Sets requires 3+ nodes total, the definition of the Fault Set itself is about availability (B) and its hierarchy (D).

## NEW QUESTION # 73

What is a key requirement for adding new nodes to an existing PowerFlex cluster?

- A. Assign VLAN tags for replication traffic
- **B. Validate hardware compatibility with the cluster**
- C. Ensure the new nodes are in the same Protection Domain
- D. Preconfigure deduplication on the new nodes

**Answer: B**

Explanation:

\* Validate hardware compatibility (Option C): The most critical technical requirement is ensuring the new nodes are compatible with the existing cluster. This includes verifying that the CPU, RAM, and most importantly, the network interface cards (NICs) and storage devices match the existing nodes or are supported in a mixed-node configuration. Adding a node with incompatible hardware can cause instability or performance degradation (the "straggler" effect).

Incorrect Options:

\* Same Protection Domain (A): You can add nodes to a new Protection Domain if you are creating a new fault zone.

\* Preconfigure deduplication (B): Deduplication is a Storage Pool setting, not a node setting.

\* VLAN tags (D): While networking is important, hardware compatibility is the fundamental prerequisite before configuring network tags.
