### **NEW QUESTION # 230**

The process which frees the resources from their physical constraints to enable pooling is called:

- A. Automation
- B. Classification
- **C. Abstraction**
- D. Orchestration

**Answer: C**

Explanation:

Abstraction, often via virtualization, frees the resources from their physical constraints to enable pooling. Then a set of core connectivity and delivery tools(orchestration)ties these abstracted resources together, creates the pools, and provides the automation to deliver them to customers.

### **NEW QUESTION # 231**

Which AI workload mitigation strategy best addresses model inversion attacks that threaten data confidentiality?

- A. Model hardening
- B. Encryption
- C. Secure multi-party computation
- **D. Differential privacy**

**Answer: D**

Explanation:

Differential privacy is a strategy designed to protect data confidentiality by ensuring that the output of a machine learning model does not expose sensitive information about individual data points. In the context of model inversion attacks, where attackers try to infer confidential data from the model, differential privacy introduces noise into the model's output in a way that prevents attackers from accurately reconstructing the input data. This helps safeguard against attacks that threaten the privacy of the data used to train the model.

Secure multi-party computation is useful for enabling collaborative computation on encrypted data but does not specifically address model inversion attacks. Encryption is important for securing data at rest or in transit but does not directly protect against model inversion attacks. Model hardening refers to general measures to make models more robust to adversarial attacks, but it does not directly mitigate the specific risk of model inversion attacks related to data confidentiality.

### **NEW QUESTION # 232**

Enterprise Risk Management is part of over all information Risk Management of the organization

- A. True
- **B. False**

**Answer: B**

Explanation:

It is False and it is other way round. Information Risk management is part of Enterprise Risk.

### NEW QUESTION # 233

Which practice ensures container security by preventing post-deployment modifications?

- A. Implementing dynamic network segmentation policies
- B. Employing Role-Based Access Control (RBAC) for container access
- C. Regular vulnerability scanning of deployed containers
- D. Use of immutable containers

**Answer: D**

Explanation:

Immutable containers are not altered post-deployment, ensuring the integrity of the deployed environment and reducing the risk of unauthorized modifications. Reference: [CCSK v5 Curriculum, Domain 8 - Cloud Workload Security][16†source].

### NEW QUESTION # 234

What is one of the primary advantages of including Static Application Security Testing (SAST) in Continuous Integration (CI) pipelines?

- A. Increases the speed of deployment to production
- B. Improves runtime performance of the application
- C. Enhances the user interface of the application
- D. Identifies code vulnerabilities early in the development

**Answer: D**

Explanation:

One of the primary advantages of including Static Application Security Testing (SAST) in Continuous Integration (CI) pipelines is that it allows developers to identify code vulnerabilities early in the development process. By scanning the source code for potential security issues as it is being written and integrated into the pipeline, SAST helps to catch vulnerabilities before they make it to later stages of development or production, improving overall security and reducing the cost and effort of fixing issues later.

While SAST does not directly impact the speed of deployment, runtime performance, or user interface, its early identification of security flaws contributes to better code quality and a more secure application.
