IBM MQ v9.4 Administrator - Professional Sample Questions (Q267-Q272):

NEW QUESTION # 267

In an IBM MQ system used by an e-commerce company, some applications produce messages much faster than consumers can process them, causing queues to fill up quickly and impacting system performance. Which MQ features can help prevent message buildup while still ensuring important orders are prioritized?

- A. Manually deleting old messages when the queue is full
- **B. Implementing message priority, defining backout queues, and configuring flow control mechanisms**
- C. Relying on non-persistent messaging to avoid storage overhead
- D. Increasing the maximum queue depth and ignoring backlogs

Answer: B

Explanation:

Message priority, backout queues, and flow control allow critical orders to be prioritized and processed first, while preventing queues from overflowing due to slower consumers.

NEW QUESTION # 268

IBM MQ provides several message delivery options. Which of the following correctly explains the difference between "synchronous" and "asynchronous" message delivery, and how an application might choose between them?

- A. Synchronous delivery writes the message to disk instantly, while asynchronous writes to memory; applications requiring low latency choose synchronous
- B. Synchronous uses client-side caching, asynchronous uses server-side buffering; applications that can tolerate duplication choose asynchronous
- C. Synchronous delivery only applies to clustered queues, asynchronous only to point-to-point queues
- **D. Synchronous delivery waits for the message to be received by the consumer before returning, while asynchronous immediately returns to the sender; applications requiring strict acknowledgment choose synchronous**

Answer: D

Explanation:

Synchronous delivery ensures that the sender waits for acknowledgment from the receiver or queue manager, guaranteeing delivery. Asynchronous delivery allows faster sending but may risk message loss if not properly configured.

NEW QUESTION # 269

In IBM MQ, when building a mission-critical airline reservation system where every booking message must be processed in strict order of arrival and must survive hardware crashes, which configuration provides both ordering guarantees and durability of messages?

- A. Implementing publish/subscribe model with non-durable subscribers for faster throughput
- B. Relying on application-level retries without MQ persistence
- C. Using non-persistent queues with high-speed network connections
- **D. Configuring persistent messages with FIFO ordering and queue manager recovery logs**

Answer: D

Explanation:

Persistent messages combined with recovery logs ensure that messages survive crashes, while FIFO ordering guarantees that booking transactions are processed in the correct sequence.

NEW QUESTION # 270

In a large enterprise, administrators configure channel exits to enforce security policies on communication links. What is the main role

of a channel exit program in IBM MQ?

- A. To apply custom logic such as authentication or auditing on channel data
- B. To provide built-in encryption for persistent messages
- C. To replicate messages across multiple clusters automatically
- D. To manage message expiry intervals before they reach the queue

Answer: A

Explanation:

Channel exits are user-written programs that can implement additional security or custom processing on channel communication, such as authentication or auditing.

NEW QUESTION # 271

When configuring an IBM MQ queue manager to ensure high availability and disaster recovery, which of the following best describes the mechanism that synchronizes messages between primary and standby queue managers automatically?

- A. MQ Multi-Instance Queue Managers use shared storage and failover to maintain continuity during a primary node failure.
- B. Replicated queues manually copy messages from primary to backup queues.
- C. Clustered queue managers replicate messages to all other queue managers in the cluster simultaneously.
- D. Persistent queues store messages to disk to prevent loss during system crashes.

Answer: A

Explanation:

MQ Multi-Instance Queue Managers allow automatic failover to a standby instance using shared storage, ensuring continuous service in case the primary queue manager fails.
