The Lpi 305-300 Exam covers a wide spectrum of topics, ranging from basic virtualization concepts to advanced containerization techniques. The test-takers will be tested on their knowledge of virtualization technologies, such as KVM, Xen, and VMware, as well as containerization technologies such as Docker and Kubernetes. They will also be assessed on their ability to manage and secure virtualized and containerized environments, including storage and network management, backup, and disaster recovery.

Lpi LPIC-3 Exam 305: Virtualization and Containerization Sample Questions (Q120-Q125):

NEW QUESTION # 120

Which of the following statements about the `commandxc-checkpoint` is correct?

- A. It creates a clone of a container.
- B. It doubles the memory consumption of the container.
- C. It only works on stopped containers.
- D. It creates a container image based on an existing container.
- **E. It writes the status of the container to a file.**

Answer: E

NEW QUESTION # 121

Which of the following statements are true about container-based virtualization? (Choose two.)

- A. Each container runs its own operating system kernel.
- B. Container-based virtualization relies on hardware support from the host system's CPU.
- C. Linux does not support container-based virtualization because of missing kernel APIs.
- **D. Different containers may use different distributions of the same operating system.**
- **E. All containers run within the operating system kernel of the host system.**

Answer: D,E

NEW QUESTION # 122

Which of the following are true regarding the CPU of a QEMU virtual machine? (Choose two.)

- **A. QEMU virtual machines support multiple virtual CPUs in order to run SMP systems.**
- B. For each QEMU virtual machine, one dedicated physical CPU core must be reserved.
- **C. The CPU architecture of a QEMU virtual machine is independent of the host system's architecture.**
- D. QEMU uses the concept of virtual CPUs to map the virtual machines to physical CPUs.
- E. Each QEMU virtual machine can only have one CPU with one core.

Answer: A,C

Explanation:

Explanation

The CPU architecture of a QEMU virtual machine is independent of the host system's architecture. QEMU can emulate many CPU architectures, including x86, ARM, Alpha, and SPARC, regardless of the host system's architecture. This allows QEMU to run

guest operating systems that are not compatible with the host system's hardware. Therefore, option A is correct. QEMU virtual machines support multiple virtual CPUs in order to run SMP systems. QEMU uses the concept of virtual CPUs (vCPUs) to map the virtual machines to physical CPUs. Each vCPU is a thread that runs on a physical CPU core. QEMU allows the user to specify the number of vCPUs and the CPU model for each virtual machine. QEMU can run SMP systems with multiple vCPUs, as well as single-processor systems with one vCPU. Therefore, option E is also correct. The other options are incorrect because they do not describe the CPU of a QEMU virtual machine. Option B is wrong because QEMU virtual machines can have more than one CPU with more than one core. Option C is wrong because QEMU does not require a dedicated physical CPU core for each virtual machine. QEMU can share the physical CPU cores among multiple virtual machines, depending on the load and the scheduling policy.

Option D is wrong because QEMU does not use the term CPU, but vCPU, to refer to the virtual machines' processors. References:

NEW QUESTION # 123

Which of the following commands deletes all volumes which are not associated with a container?

- A. docker volume garbage-collect
- B. docker volume cleanup
- C. docker volume vacuum
- **D. docker volume prune**
- E. docker volume orphan -d

Answer: D

Explanation:

The command that deletes all volumes which are not associated with a container is docker volume prune. This command removes all unused local volumes, which are those that are not referenced by any containers. By default, it only removes anonymous volumes, which are those that are not given a specific name when they are created. To remove both unused anonymous and named volumes, the --all or -a flag can be added to the command. The command will prompt for confirmation before deleting the volumes, unless the --force or -f flag is used to bypass the prompt. The command will also show the total reclaimed space after deleting the volumes. The other commands listed in the question are not valid or do not have the same functionality as docker volume prune. They are either made up, misspelled, or have a different purpose. These commands are:

* docker volume cleanup: This command does not exist in Docker. There is no cleanup subcommand for docker volume.

* docker volume orphan -d: This command does not exist in Docker. There is no orphan subcommand for docker volume, and the -d flag is not a valid option for any docker volume command.

* docker volume vacuum: This command does not exist in Docker. There is no vacuum subcommand for docker volume.

* docker volume garbage-collect: This command does not exist in Docker. There is no garbage-collect subcommand for docker volume.

NEW QUESTION # 124

Which of the following commands boots a QEMU virtual machine using hardware virtualization extensions?

- **A. qemu -accel kvm -drive file=debian.img -cdrom debian.iso -m 1024 -boot d**
- B. vm -kvm -drive file=debian.img -cdrom debian.iso -m 1024 -boot d
- C. qvm start -vmx -drive file=debian.img -cdrom debian.iso -m 1024 -boot d
- D. qvirt -create -drive file=debian.img -cdrom debian.iso -m 1024 -boot d -driver hvm
- E. qemu-hw -create -drive file=debian.img -cdrom debian.iso -m 1024 -boot d

Answer: A
