UiPath Automation Business Analyst Associate Exam (2023.10) Sample Questions (Q15-Q20):

NEW QUESTION # 15

Which of the following describes a key feature of RPA when dealing with legacy systems?

- A. RPA can only operate on modern cloud-based systems
- B. RPA requires complete system overhauls to function
- C. RPA can interact with legacy systems without the need for major changes
- D. RPA does not support integration with legacy systems

Answer: C

Explanation:

A key advantage of Robotic Process Automation (RPA) is its ability to interact with legacy systems without requiring major system changes or costly infrastructure upgrades. This is especially beneficial in large enterprises where legacy systems are deeply embedded in operations and cannot be easily modified or replaced.

RPA tools like UiPath operate at the user interface level, meaning robots mimic the way humans interact with applications—clicking buttons, entering data, reading screens—regardless of whether the underlying system is modern or legacy. This makes RPA non-invasive, meaning it doesn't interfere with the backend code or require APIs or connectors to function (though it can use them when available).

This feature allows organizations to automate processes across mainframes, desktop-based applications, and other older systems where traditional integration is too complex or expensive. As a result, businesses can achieve automation and process efficiency without waiting for digital transformation or major IT investments.

In summary, RPA bridges the gap between old and new systems, allowing enterprises to innovate and optimize workflows without disrupting existing technologies.

NEW QUESTION # 16

In the Business Case and Technical Validation stage, what is the Automation Business Analyst responsible for?

- A. Validating business case and cost-benefit analysis
- B. Performing coding reviews
- C. Creating test cases for UAT
- D. Finalizing Solution Design Document

Answer: A

Explanation:

In the Business Case and Technical Validation stage, the Automation Business Analyst (ABA) plays a key role in validating the business case for the selected automation use cases. This includes assessing the cost-benefit ratio, projected ROI, and alignment with business goals.

The ABA evaluates how automating a process would affect productivity, cost savings, error reduction, and customer experience. They collaborate with stakeholders to collect business metrics, time savings, and resource utilization data that feed into a quantitative and qualitative justification for automation.

Their analysis helps in prioritizing automation candidates and ensures that only those with strong business value proceed to the next stages. Without this step, organizations risk automating processes that do not deliver measurable value, undermining the long-term success of their automation programs.

NEW QUESTION # 17

Which factor is assessed under "Complexity Assessment" in the context of the Process Assessment Tool?

- A. The number of screens or steps in the process
- B. The potential ROI of automation
- C. The user satisfaction score
- D. The compatibility of the applications with the automation tool

Answer: A

Explanation:

In the Process Assessment Tool, the Complexity Assessment focuses on evaluating how difficult it is to automate a given process. One of the primary factors assessed under this category is the number of screens, steps, and decision points involved in the process. The more steps or screens a process contains, the more complex it becomes from an automation standpoint.

Processes with a long sequence of actions, dynamic user interfaces, multiple system interactions, or several branches and exceptions require more development time, additional testing, and potentially more advanced logic or modular designs. This increases both development effort and long-term maintenance.

Other aspects of complexity may include the level of unstructured data, the number of applications being used, exception variability, and how frequently business rules change. However, the direct indicator of complexity captured in the tool is the number of steps or screens, as this provides a measurable representation of the automation workload.

Evaluating complexity early ensures accurate project scoping, risk assessment, and prioritization. It also helps determine whether a process is better suited for early automation waves (simple processes) or later ones (more complex automations requiring higher maturity).

NEW QUESTION # 18

Which three roles from the Implementation Team participate in the Process Analysis stage?

- A. Solution Architect, Project Manager, Business Analyst
- B. Project Manager, Developer, Client IT
- C. Automation Developer, Solution Architect, Client SME
- D. Business Analyst, Infrastructure Engineer, Project Manager

Answer: A

Explanation:

During the Process Analysis stage, the following three key roles from the Implementation Team are involved:

- * Solution Architect
- * Project Manager
- * Business Analyst

Each role brings a unique perspective and responsibility to the analysis. The business analyst focuses on understanding the business goals and documenting the As-Is process. The solution architect evaluates the process from a technical standpoint to identify automation opportunities and potential roadblocks. The project manager oversees the planning and timelines to ensure alignment with the broader project goals.

This collaborative analysis results in a comprehensive and well-documented Process Definition Document (PDD), which becomes the foundation for the subsequent design and development phases. This stage is critical to ensuring that the correct processes are chosen for automation and that the team is aligned on the scope and expectations.

NEW QUESTION # 19

What is the key responsibility of the Client Team Project Manager?

- A. Managing internal client-side processes and escalations
- B. Writing automation code in UiPath Studio
- C. Overseeing infrastructure installation and configuration
- D. Creating the Solution Design Document

Answer: A

Explanation:

The Client Team Project Manager is responsible for managing internal client-side processes and handling escalations during the implementation lifecycle. This role acts as the client's primary liaison with the Implementation Team and ensures that internal dependencies and commitments are met.

Responsibilities include:

- * Coordinating Subject Matter Experts (SMEs) and business stakeholders
- * Communicating internal timelines and availability
- * Facilitating approval processes for documents and deliverables
- * Escalating and resolving client-side roadblocks
- * Ensuring that the client team is aligned with project expectations

Their involvement ensures that the implementation proceeds without delays caused by unavailability, access issues, or lack of communication from the client side.
