Cisco Implementing Cisco Enterprise Wireless Networks Sample Questions (Q260-Q265):

NEW QUESTION # 260

A wireless network has two RF groups where Cisco WLCs are joined. APs are associated with different controllers using the round-robin approach. Rogue containment must be deployed in all controllers, but the network must not be affected by any RRM neighbor packets sent by friendly APs. Which AP authentication protection type must be enabled?

- A. AP Wireless Protection Rules
- B. AP Access Control
- C. AP Authentication
- D. AP Security

Answer: C

Explanation:

In a wireless network with multiple controllers and APs, AP Authentication is the appropriate protection type to ensure that rogue containment is deployed without being affected by RRM (Radio Resource Management) neighbor packets sent by friendly APs. AP Authentication ensures that only authorized APs are allowed to join the network, preventing rogue APs from connecting. AP Authentication verifies the identity of APs attempting to join the network, ensuring they are legitimate and authorized. This prevents rogue APs from being added to the network and ensures that RRM neighbor packets are only sent by trusted APs.
