We have applied the latest technologies to the design of our Nutanix NCP-BC-7.5 exam prep not only on the content but also on the displays. As a consequence you are able to keep pace with the changeable world and remain your advantages with our Nutanix NCP-BC-7.5 training braindumps. Besides, you can consolidate important knowledge for you personally and design customized study schedule or to-do list on a daily basis.

Our NCP-BC-7.5 free demo provides you with the free renewal in one year so that you can keep track of the latest points happening in the world. As the questions of our NCP-BC-7.5 exam dumps are involved with heated issues and customers who prepare for the NCP-BC-7.5 Exams must haven't enough time to keep trace of NCP-BC-7.5 exams all day long. In this way, there is no need for you to worry about that something important have been left behind. Therefore, you will have more confidence in passing the exam.

2026 Exam NCP-BC-7.5 Blueprint | High Pass-Rate Reliable NCP-BC-7.5 Study Guide: Nutanix Certified Professional - Business Continuity (NCP-BC) 7.5 100% Pass

If you buy the NCP-BC-7.5 study materials of us, we ensure you to pass the exam. Since the NCP-BC-7.5 study materials have the quality and the accuracy, and it will help you pass exam just one time. Buying NCP-BC-7.5 exam dumps are pass guaranteed and money back guaranteed for the failure. Furthermore, we choose international confirmation third party for payment for the NCP-BC-7.5 Exam Dumps, therefore we can ensure you the safety of your account and your money. The refund money will return to your payment account.

Nutanix Certified Professional - Business Continuity (NCP-BC) 7.5 Sample Questions (Q50-Q55):

NEW QUESTION # 50

An administrator is testing the failover scenarios from a source availability zone (AZ1) to a destination availability zone (AZ2). The administrator successfully performs an unplanned failover from AZ1 to AZ2.

The administrator then immediately tries to use the unplanned failover option to fail the VM back to AZ1, but does not see the VM listed under Recovery Plan. What could be the cause?

- **A. Clean up of Entities is needed to perform failback.**
- B. Unplanned failover cannot be used to failback VMs.
- C. Recovery Plan is not bi-directional.
- D. Replication is not yet successful from AZ2 to AZ1.

Answer: A

Explanation:

Failback is a critical phase of the disaster recovery lifecycle where workloads are returned to their original primary site. When an "Unplanned Failover" is executed, the system assumes the primary site is gone or unmanaged. Once the primary site (AZ1) is restored, the administrator cannot simply "re-run" the failover in reverse without preparing the source site. The "Clean up of Entities" (Option C) is a mandatory step that must be performed on the original primary cluster after it returns to a healthy state. This process clears the stale VM registrations and metadata that existed prior to the outage, signaling to the Nutanix orchestrator that AZ1 is now ready to re-receive the workloads. Until this cleanup is completed, the Recovery Plan will not list the VMs as eligible for failback because it still detects the "ghost" of the VM at the destination. While reverse replication (Option B) is also necessary to prevent data loss during failback, the reason the VMs are entirely missing from the Recovery Plan interface during the initial failback attempt is the lack of entity cleanup. Performing this cleanup ensures a smooth transition back to primary production without metadata conflicts or registration errors.

NEW QUESTION # 51

An administrator logs into Prism Central (PC) and notices that a replication of a recovery point is still ongoing from Cluster A to Cluster B on a new setup.

- * The bytes being replicated aren't changing.
- * Both site's virtual IP addresses are reachable.
- * Connectivity between PC/PE is good.
- * There is a dedicated LAN between the clusters.

What could be causing this replication to be stuck?

- A. Port 2020 is blocked between CVMs.
- **B. Protection Policy is incorrectly configured.**
- C. Acropolis is down at the Remote Site.
- D. Port 2030 is blocked between CVMs.

Answer: B

Explanation:

When a replication job is marked as "ongoing" but the progress (bytes completed) is stagnant, it typically indicates a mismatch in the configuration or a failure in the orchestration logic rather than a total network blackout, especially when virtual IPs are confirmed reachable. In a "new setup," a very common root cause is an incorrectly configured Protection Policy.

This can include issues such as mismatched category assignments, incorrect target site selection, or an invalid replication schedule that the system is unable to initialize properly. If the policy itself is misconfigured—for instance, if it is attempting to replicate to a storage container that hasn't been mapped or lacks permissions—the Cerebro service may initiate the task but then fail to progress the data transfer. While blocked ports (Options C and D) are common culprits in replication failures, they usually result in immediate "unreachable

" alerts or job failures rather than a "stuck" status where connectivity is otherwise reported as healthy. If the Acropolis service were down at the remote site (Option A), the cluster would likely report the site as disconnected or show a critical service alert in Prism. Therefore, the most logical first area to investigate in a new, non-progressing setup is the logic and settings defined within the Protection Policy itself.

NEW QUESTION # 52

An administrator has been tasked with configuring a Nutanix replication solution that provides an RPO of zero. Which solution should the administrator choose?

- A. Async Replication
- **B. Synchronous Replication**
- C. Cloud Connect

- D. Nearsync Replication

Answer: B

Explanation:

The Recovery Point Objective (RPO) is a measure of how much data an organization can afford to lose during an outage. An RPO of zero means that absolutely no data loss is tolerated; every write performed at the primary site must be safely committed to the recovery site before the application receives a confirmation. In the Nutanix portfolio, Synchronous Replication (Option A) is the only technology that guarantees this level of data protection. It mirrors every write in real-time between two clusters, ensuring they are always in perfect synchronization. In contrast, Nearsync Replication (Option B) allows for very low RPOs (as low as 20 seconds to 1 minute), but it is still fundamentally an asynchronous process using lightweight snapshots, meaning some "data-in-flight" could be lost. Async Replication (Option C) typically involves RPOs of one hour or more and is used for less critical workloads. Cloud Connect (Option D) is a legacy feature for off-site backup and does not support zero-RPO requirements. Synchronous Replication is the "gold standard" for Tier-1, mission-critical applications where data integrity and zero loss are the primary business requirements, provided the network latency between sites is 5ms or less.

NEW QUESTION # 53

An administrator has received the following alert:

Replication was skipped for protection domain < Protection Domain Name > of the latest snapshot < Snapshot ID > to remote site < Remote Cluster Name > . Replication was skipped as a newer Recovery Point was available snapshots that may have been skipped.

The administrator begins gathering troubleshooting information and determines the following:

- * The VM has been replicating to this cluster successfully for at least 6 months
- * The bandwidth has been sufficient to this point and hasn ' t caused an issue before
- * Network connectivity is good and all necessary ports remain open and reachable
- * There aren ' t hardware issues, and software is up to date

What else could have caused this alert?

- A. A new Availability Zone was paired to Prism Central.
- **B. The VM had a significant one-time surge in change rate.**
- C. Protection Policy schedule was temporarily paused.
- D. This was a first seed replication without a reference snapshot.

Answer: B

Explanation:

The Nutanix Cerebro service manages replication by scheduling snapshots and transferring the delta changes to the remote site. In an asynchronous replication schedule, if a new snapshot is taken before the previous one has finished replicating, the system faces a choice. To ensure that the most current data is available at the recovery site as quickly as possible, Nutanix may "skip" the replication of an older pending snapshot in favor of starting the replication of the newest one.

In this scenario, all infrastructure components (bandwidth, ports, hardware) are verified as healthy and have supported successful replication for months. This points toward a data-level issue rather than a connectivity issue. A "significant one-time surge in change rate" (Option D) means the VM generated a massive amount of new data blocks (churn) in a short period. Because the "Snapshot-on-wire" transfer size is directly tied to the number of changed blocks, this specific snapshot would take much longer than usual to replicate. If the transfer time exceeds the RPO interval, the next scheduled snapshot will trigger. The Cerebro service will see that it has a newer recovery point ready to go and will skip the "stuck" or slow-moving older snapshot to maintain the most recent RPO possible at the target. This behavior generates the "Replication was skipped" warning to notify the administrator that the historical sequence was interrupted due to a temporary imbalance between data churn and available throughput.

NEW QUESTION # 54

What is the bandwidth limit of a single Nutanix Cloud Gateway for IPSec traffic?

- A. 10 Gbps

- B. 500 Mbps
- C. 250 Mbps
- **D. 1 Gbps**

Answer: D

Explanation:

The Nutanix Cloud Gateway serves as a critical bridge between on-premises Nutanix clusters and the Nutanix Cloud Availability Zone (AZ). Its primary role is to provide a secure, encrypted tunnel for replicating recovery points and managing disaster recovery orchestration metadata. When utilizing standard IPsec for this traffic, the system architecture imposes certain throughput limitations based on the processing capabilities of the gateway instance. For a single Nutanix Cloud Gateway, the maximum supported bandwidth for IPsec- encrypted traffic is 1 Gbps.

This 1 Gbps limit is an important consideration for BCDR planning, as it defines the maximum "Snapshot-on-wire" throughput available for a given protection policy. If an organization has a high data change rate (churn) that exceeds 1 Gbps of sustained replication traffic, the Recovery Point Objective (RPO) may be at risk of lag. While the physical network link might be 10 Gbps or higher, the encryption overhead of the IPsec protocol within the gateway VM is the limiting factor. To achieve higher aggregate throughput, administrators would need to deploy multiple gateways or consider high-performance direct connectivity options if available.

Understanding this 1 Gbps threshold ensures that administrators can accurately size their replication windows and manage expectations for initial seed transfers and ongoing delta synchronization to the cloud AZ.

NEW QUESTION # 55

.....

All points of questions are correlated with the newest and essential knowledge. The second one of NCP-BC-7.5 test guide is emphasis on difficult and hard-to-understand points. Experts left notes for your reference, and we believe with their notes things will be easier. In addition, the new supplementary will be sent to your mailbox if you place order this time with beneficial discounts at intervals. So our NCP-BC-7.5 Exam Questions mean more intellectual choice than other practice materials.

Reliable NCP-BC-7.5 Study Guide: <https://www.examcost.com/NCP-BC-7.5-practice-exam.html>

So you can get the useful NCP-BC-7.5 valid practice torrent on the cheap, and we also give you some discounts on occasion, Certification exam training materials ExamCost Reliable NCP-BC-7.5 Study Guide provided with ultra-low price and high quality immersive questions and answersdedication to the majority of candidates, Nutanix Exam NCP-BC-7.5 Blueprint Our teaching staff pays close attention to new information of exam.

If it did, tap Yes, This Code Works in the window, What Is IP Telephony Physical Security All About, So you can get the useful NCP-BC-7.5 valid practice torrent on the cheap, and we also give you some discounts on occasion.

Free PDF Quiz Nutanix - NCP-BC-7.5 - Nutanix Certified Professional - Business Continuity (NCP-BC) 7.5 –Valid Exam Blueprint

Certification exam training materials ExamCost provided NCP-BC-7.5 Test Questions with ultra-low price and high quality immersive questions and answersdedication to the majority of candidates.

Our teaching staff pays close attention to new information NCP-BC-7.5 of exam, In the century today, we have to admit that unemployment is getting worse, Because a lot of people hope to get the certification by the related exam, now many leaders of companies prefer to the candidates who have the NCP-BC-7.5 certification.
