

最新SailPoint認證IdentityIQ-Associate考試考題

Fast2test網站在通過IdentityIQ-Associate資格認證考試的考生中有著良好的口碑。這是大家都能看得到的事實。Fast2test以它強大的考古題得到人們的認可，只要你選擇它作為你的考前復習工具，就會在IdentityIQ-Associate資格考試中有非常滿意的收穫，這也是大家有目共睹的。現在馬上去網站下載免費試用版本，你就會相信自己的選擇不會錯。

SailPoint IdentityIQ-Associate 考試大綱：

主題	簡介
主題 1	<ul style="list-style-type: none">• Governance: Addresses how access certifications are conducted and how policy violations are defined and detected across the organization.
主題 2	<ul style="list-style-type: none">• Applications: Focuses on how applications and connectors are configured in IdentityIQ, including schemas, correlation, aggregation tasks, and resolving uncorrelated accounts.
主題 3	<ul style="list-style-type: none">• User-Driven Requests: Explains how users submit access requests, what request types are available, and how QuickLink Populations control who can request what for whom.
主題 4	<ul style="list-style-type: none">• Access Modeling: Covers how entitlements and roles are defined, cataloged, and assigned to identities within IdentityIQ.
主題 5	<ul style="list-style-type: none">• Identity Modeling: Explains how identity data is structured and managed through IdentityCubes, identity attributes, groups, populations, and manager correlation.
主題 6	<ul style="list-style-type: none">• Provisioning: Covers how IdentityIQ provisions access, including triggering actions, provisioning policies, Lifecycle Events, and attribute synchronization.

IdentityIQ-Associate考試題庫， IdentityIQ-Associate學習筆記

Fast2test的IdentityIQ-Associate考古題和實際的認證考試一樣，不僅包含了實際考試中的所有問題，而且考古題的軟體版完全類比了真實考試的氛圍。使用了Fast2test的考古題，你在參加考試時完全可以應付自如，輕鬆地獲得高分。

最新的 Identity Security Engineer IdentityIQ-Associate 免費考試真題 (Q10-Q15):

問題 #10

Is this statement true for IdentityIQ application definitions?
Applications in IdentityIQ are named with the connector that is selected.

- A. No
- B. Yes

答案： A

解題說明：

No. In SailPoint IdentityIQ, the application name is a configurable label assigned to the application object and does not have to match the connector selected. The application definition represents an external system or source, while the connector defines the technical integration method used to communicate with that system. These are related configuration elements, but they are not the same field and one does not automatically name the other.

For example, an application could be named "Corporate Directory," "North America Active Directory," or "HR Source," while using an LDAP, Active Directory, JDBC, Delimited File, Web Services, or another connector type. The connector selection determines available configuration settings, supported schema behavior, aggregation options, and provisioning capabilities. The application name is used for identification within IdentityIQ, reporting, certifications, requests, policies, and administrative configuration.

Therefore, the statement is incorrect because IdentityIQ applications are not named by the selected connector. They are named by the administrator or implementer according to the business or system context. Reference topics: Applications, application definition, connector selection, connector-dependent settings, schemas, aggregation, and provisioning support.

問題 #11

Is this displayed in the Identity Warehouse?
List of objects the user owns

- A. Yes
- B. No

答案： A

解題說明：

Yes. The Identity Warehouse in SailPoint IdentityIQ is used to display identity-centered information from the IdentityCube and related IdentityIQ object relationships. In addition to core identity attributes, accounts, roles, entitlements, manager relationships, and direct reports, IdentityIQ can show objects for which the identity is designated as the owner. Ownership is an important governance concept because owners may be responsible for approving access, maintaining roles, reviewing entitlements, managing applications, or participating in certification and remediation processes.

An object owner in IdentityIQ may be associated with configurable objects such as roles, applications, managed attributes, policies, or other governance-related items. Displaying owned objects from the identity view helps administrators and governance users understand the responsibilities assigned to that identity, not just the access held by the identity. This distinction matters because IdentityIQ models both "what access the identity has" and "what governance responsibilities the identity owns." Therefore, a list of objects the user owns is appropriately displayed in the Identity Warehouse when ownership relationships exist and the viewer has sufficient permission. Reference topics: Identity Modeling, IdentityCube contents, Identity Warehouse, object ownership, manager relationships, and governance responsibility modeling.

問題 #12

Is this statement about aggregation task options true?

The Detect deleted accounts task option causes IdentityIQ to ignore any accounts from the data source that have been previously deleted from IdentityIQ.

- A. No
- B. Yes

答案： A

解題說明：

No. The "Detect deleted accounts" aggregation task option is not used to ignore accounts that were previously deleted from IdentityIQ. Its purpose is to compare the accounts returned by the current aggregation with the accounts already stored in IdentityIQ for that application. When an account exists in IdentityIQ but is no longer found in the authoritative aggregation results from the source application, IdentityIQ can treat that account as deleted or removed from the target system.

This option helps keep IdentityIQ's account inventory accurate by identifying stale Links that remain in IdentityIQ even though the corresponding account is no longer present on the application. It is especially important for governance accuracy because certifications, policy checks, identity warehouse views, and access reporting rely on current account and entitlement data. The statement is incorrect because it reverses the behavior. Detecting deleted accounts is about recognizing accounts missing from the source during aggregation, not ignoring newly returned source accounts that were once deleted in IdentityIQ. Reference topics: Applications, aggregation task options, account aggregation, deleted account detection, Link maintenance, IdentityCube account data, and application data reconciliation.

問題 #13

Is this statement true for the use of applications?

They are defined in IdentityIQ to represent the systems from which identities are read.

- A. No
- B. Yes

答案: A

解題說明:

The statement is not technically accurate. In SailPoint IdentityIQ, applications are defined to represent external systems, platforms, directories, databases, or resources from which account, group, entitlement, and attribute data are aggregated, and in some cases to which provisioning changes are written. IdentityIQ does not generally "read identities" directly from applications. Instead, it reads account records and associated attributes from applications, then uses identity correlation, authoritative-source logic, and identity refresh processing to construct or update IdentityCubes.

This distinction is fundamental. An application may be an authoritative source, such as an HR system, where account attributes contribute heavily to identity creation and lifecycle state. However, the object read from the source is still an account or source record, not an IdentityIQ identity object. The identity is modeled inside IdentityIQ after aggregation and correlation occur.

Therefore, the more precise statement is that applications represent systems from which IdentityIQ reads account and access data, not systems from which IdentityIQ simply reads identities. Reference topics:

Applications, application definition, account aggregation, authoritative applications, correlation, IdentityCube creation, and Identity Modeling.

問題 #14

Is this a true statement about the provisioning process in IdentityIQ?

The provisioning plan will never be changed or updated.

- A. No
- B. Yes

答案: A

解題說明:

No. In SailPoint IdentityIQ, the provisioning plan is not necessarily static after it is initially created. A provisioning plan represents the requested account and access changes to be fulfilled, such as creating an account, modifying attributes, adding or removing entitlements, disabling an account, or deleting an account. During provisioning processing, IdentityIQ may update, expand, enrich, or transform the plan before fulfillment.

For example, provisioning policies may require additional data before a requested operation can be completed. Workflow logic, rules, approval outcomes, role expansion, dependency processing, and application-specific provisioning configuration can also affect the final provisioning instructions. IdentityIQ may compile the plan into executable provisioning activity, split requests by application, route items to connectors, or generate manual work items when direct connector provisioning is not available. These processing steps can alter what is ultimately sent to the target system or assigned for fulfillment.

Therefore, the statement that the provisioning plan will never be changed or updated is incorrect. Reference topics: Provisioning, provisioning plans, provisioning policies, plan compilation, workflows, connector provisioning, manual fulfillment, and application-specific provisioning behavior.
