Docker Certified Associate (DCA) Exam Sample Questions (Q93-Q98):

NEW QUESTION # 93

What is the purpose of multi-stage builds?

- A. Better logical separation of Dockerfile instructions for better readability
- B. Faster image builds by allowing parallel execution of Docker builds
- C. Better caching when building Docker images
- **D. Optimizing images by copying artifacts selectively from previous stages**

Answer: D

NEW QUESTION # 94

A users attempts to set the system time from inside a Docker container are unsuccessful. Could this be blocking this operation?

Solution: Linux capabilities

- A. No
- **B. Yes**

Answer: B

NEW QUESTION # 95

Will this configuration achieve fault tolerance for managers in a swarm?

Solution: an odd number of manager nodes, totaling more than two

- A. No
- **B. Yes**

Answer: B

Explanation:

Explanation

This configuration will achieve fault tolerance for managers in a swarm, because an odd number of manager nodes allows for quorum-based consensus among managers and avoids split-brain scenarios. According to the official documentation, having more than two manager nodes ensures that there is always at least one manager available in case of failures.

NEW QUESTION # 96

Two development teams in your organization use Kubernetes and want to deploy their applications while ensuring that Kubernetes-specific resources, such as secrets, are grouped together for each application.

Is this a way to accomplish this?

Solution. Create a collection for for each application.

- **A. No**
- B. Yes

Answer: A

Explanation:

= Creating a collection for each application is not a way to accomplish this. A collection is a term used by Ansible to describe a package of related content that can be used to automate the management of Kubernetes resources¹. A collection is not a native Kubernetes concept and does not group resources together within the cluster. To group Kubernetes-specific resources, such as secrets, for each application, you need to use namespaces. A namespace is a logical partition of the cluster that allows you to isolate

resources and apply policies to them². You can create a namespace for each application and store the secrets and other resources in that namespace. This way, you can prevent conflicts and limit access to the resources of each application. To create a namespace, you can use the `kubectl create namespace` command or a `yaml` file². To create a secret within a namespace, you can use the `kubectl create secret` command with the `--namespace` option or a `yaml` file with the `metadata.namespace` field³. References:

NEW QUESTION # 97

Is this a Linux kernel namespace that is disabled by default and must be enabled at Docker engine runtime to be used?

Solution:pid

- A. No
- B. Yes

Answer: A

Explanation:

Explanation

= The `pid` namespace is not a Linux kernel namespace that is disabled by default and must be enabled at Docker engine runtime to be used. The `pid` namespace is one of the six namespaces that are enabled by default when you run a container with Docker¹. The `pid` namespace isolates the process ID number space, meaning that processes in different `pid` namespaces can have the same PID². This allows containers to have their own `init` process with PID 1 and to limit the visibility and interaction of processes between containers and the host³. To disable the `pid` namespace, you need to use the `--pid` option with the `docker run` command and specify the host or another container as the `pid` mode. References:

- * Docker run reference | Docker Docs
- * `pid_namespaces(7)` - Linux manual page - `man7.org`
