NVIDIA AI Operations Sample Questions (Q23-Q28):

NEW QUESTION # 23

A system administrator is troubleshooting a Docker container that is repeatedly failing to start. They want to gather more detailed information about the issue by generating debugging logs.

Why would generating debugging logs be an important step in resolving this issue?

- A. Debugging logs fix issues related to container performance and resource allocation.
- B. Debugging logs prevent the container from being removed after it stops, allowing for easier inspection.
- **C. Debugging logs provide detailed insights into the Docker daemon's internal operations.**
- D. Debugging logs disable other logging mechanisms, reducing noise in the output.

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Generating debugging logs enables detailed visibility into the internal operations of the Docker daemon. These logs expose low-level errors, misconfigurations, and runtime issues that standard logs might not capture, making them essential for diagnosing why a container repeatedly fails to start.

NEW QUESTION # 24

Which technique helps reduce latency in real-time inference systems by precomputing frequently used features and storing them for quick access during prediction requests?

- A. Data augmentation
- B. Online learning
- C. Batch processing
- **D. Feature caching**

Answer: D

Explanation:

Feature caching stores precomputed features to reduce computation during inference. This improves response time and efficiency, especially in real-time systems where low latency is critical for user experience.

NEW QUESTION # 25

What is the primary benefit of using NVIDIA MIG in a multi-tenant environment?

- A. Simplified container deployment.
- B. Improved CPU performance.
- **C. Guaranteed isolation and resource allocation for each tenant.**
- D. Decreased memory usage.
- E. Increased network bandwidth.

Answer: C

Explanation:

MIG's primary benefit is to provide guaranteed isolation and resource allocation for each tenant in a multi-tenant environment. This ensures that each tenant has dedicated GPU resources and that their workloads do not interfere with each other.

NEW QUESTION # 26

A Slurm user needs to display real-time information about the running processes and resource usage of a Slurm job. Which command should be used?

- A. `scontrol show job <jobid>`
- B. `sinfo -j <jobid>`
- C. `smap -j <jobid>`
- **D. `sstat -j <job(.step)>`**

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The Slurm command `sstat` is designed to provide real-time statistics about running jobs, including process-level details and resource usage such as CPU, memory, and GPU utilization. `Usage: sstat -j <jobid> | sstat -j <jobid> .step>` allows monitoring of active job resource consumption.

* `smap` is not a standard Slurm command.

* `scontrol show job` gives job configuration and status but not real-time resource usage.

* `sinfo` displays node and partition information, not job-specific resource stats.

Therefore, `sstat` is the correct command for real-time job process and resource monitoring.

NEW QUESTION # 27

A user reports that they are unable to submit jobs to a specific partition. You've verified that the partition exists and is enabled. What are the possible reasons for this?

- A. The user's account is not associated with the partition.

- B. All of the above
- C. The partition's state is set to INACTIVE.
- D. The user has exceeded their QOS limit.
- E. The 'MaxNodes' parameter for the partition is set to 0.

Answer: B

Explanation:

All the options are reasons for the user to be unable to submit jobs to a specific partition. All must be checked to solve the root problem.

NEW QUESTION # 28
