The Prep4sureExam supports VMware 3V0-21.23 exam candidates by listening to their worries, resolving their problems, and offering them actual exam questions. The exam candidate has several concerns before choosing any platform. They want a platform that satisfies them and promises to help them prepare for the 3V0-21.23 test successfully on the first time.

VMware 3V0-21.23 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">VMware Products and Solutions: Targeting VMware Engineers, this section describes VMware Cloud Foundation architecture, its components like vSphere and NSX, benefits such as automation and scalability, and use cases like hybrid cloud environments. It assesses understanding of VMware Validated Solutions.
Topic 2	<ul style="list-style-type: none">Plan and Design the VMware Solution: This part targets Solution Designers, evaluating their ability to gather business objectives, create conceptual models based on these objectives, develop logical designs, and translate them into physical designs that meet specific requirements like manageability or security.
Topic 3	<ul style="list-style-type: none">IT Architectures, Technologies, Standards: This section of the exam measures the skills of IT Architects and covers differentiating between business and technical requirements, as well as conceptual, logical, and physical design. A key skill measured is "Designing System Availability."

VMware vSphere 8.x Advanced Design Sample Questions (Q56-Q61):

NEW QUESTION # 56

An architect is designing a VMware solution for a customer to meet the following requirements:

- The solution must use investments in existing storage array that supports both block and file storage.
- The solution must support the ability to migrate workloads between hosts within a cluster.
- The solution must support resource management priorities.
- The solution must support the ability to connect virtual machines directly to LUNs.
- The solution should use existing 32G fabric infrastructure. There is no budget for additional physical hardware.

Which design decision should the architect make to meet these requirements?

- A. The ESXi hosts will leverage Fibre Channel over Ethernet (FCoE).
- **B. The ESXi hosts will leverage Fibre Channel (FC).**
- C. The ESXi hosts will leverage NFS.
- D. The ESXi hosts will leverage iSCSI.

Answer: B

NEW QUESTION # 57

During the planning and designing phase, what are the two main considerations for workload placement within a vSphere environment? (Choose two.)

- A. Power consumption of the server hardware
- **B. Number of physical CPU cores on the server**
- C. Application software licensing costs
- **D. Network bandwidth availability**

Answer: B,D

NEW QUESTION # 58

An architect is updating the design for a vSphere environment.

During a workshop focused on security, the following has been identified:

It has been determined that any configuration of ESXi hosts can only be completed via VMware vCenter. The Direct Console User Interface (DCUI) service must be disabled on ESXi hosts. The SSH service must be disabled on ESXi hosts. Based on the information from the workshop, which element does the architect need to include in the design?

- A. Strict Lockdown Mode with a defined Exception User list
- B. Normal Lockdown Mode
- **C. Strict Lockdown Mode**
- D. Normal Lockdown Mode with a defined Exception User list

Answer: C

Explanation:

Strict Lockdown Mode is the correct choice because it restricts all access to the ESXi host directly, ensuring that configuration can only be performed through VMware vCenter. This is in line with the requirement that configuration can only be done via vCenter. Strict Lockdown Mode disables the Direct Console User Interface (DCUI) and SSH services, which aligns with the customer's requirement to have these services disabled for security purposes.

NEW QUESTION # 59

An architect is designing the virtual networking components of a vSphere-based solution that will provide an environment for the development of a new latency sensitive stock trading application.

The following information was identified within the initial meeting with the customer:

The customer has vCenter Standard and vSphere Standard licenses left over from a previous project.

The customer's CFO has approved budget for additional purchases, if required.

The following requirements were also identified during the meeting:

The solution must support 500 development workloads concurrently running in the secondary site.

The solution must support the ability to complete all vSphere Operational Management centrally.
 The solution must ensure business-critical applications are not impacted by vSphere system-level operations.
 Given the requirements, the architect has decided on a single 20-node cluster for development.
 Which three additional design decisions should the architect make to meet these requirements? (Choose three.)

- A. The solution will deploy VMware vSphere Standard on all hosts within the cluster.
- B. The solution will deploy a single VMware Standard Switch that will be configured identically on each host.
- C. The solution will configure Traffic Shaping policies to restrict network bandwidth on ingress and egress.
- **D. The solution will configure Network I/O control to ensure that system-level bandwidth does not impact workload network traffic.**
- **E. The solution will deploy a single vSphere Distributed Switch with each host connected to it.**
- **F. The solution will deploy VMware vSphere Enterprise Plus on all hosts within the cluster.**

Answer: D,E,F

Explanation:

The solution will deploy VMware vSphere Enterprise Plus on all hosts within the cluster.

VMware vSphere Enterprise Plus offers advanced networking and storage features that will support the required high availability, performance, and management capabilities. Features such as Distributed Switches and Network I/O Control (NIOC) are critical to meeting the business-critical application and performance requirements for the latency-sensitive stock trading application.

The solution will deploy a single vSphere Distributed Switch with each host connected to it.

A vSphere Distributed Switch (VDS) is ideal for managing network configurations centrally across multiple hosts, which meets the requirement for centralized vSphere operational management. It also ensures consistent network configurations and simplifies network management at scale.

The solution will configure Network I/O control to ensure that system-level bandwidth does not impact workload network traffic.

Network I/O Control (NIOC) is essential for prioritizing network traffic, ensuring that latency-sensitive workloads are not impacted by other system-level or less critical traffic. This is crucial for the performance requirements of the stock trading application.

NEW QUESTION # 60

An architect has 50 ESXi hosts to deploy and DHCP servers are not allowed on any network.

Which automated host deployment method should the architect use?

- A. Stateful vSphere Auto Deploy
- B. Stateless vSphere Auto Deploy
- **C. Scripted installation**
- D. Interactive installation

Answer: C
